NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State time and point of departure, intended destination, and services obtained.

Flight from Dillingham to Platinum Alaska. Winds at departure point 10-15 knots per AWOS-3. Checked current weather at Togiak using Foreflight, winds 10 mph, vis 10 miles, sky clear. I called a local Platinum resident via cellular phone for a weather report: Winds calm at times, picks up 5 to 10 miles per hour, clear, 10 miles vis. We flew direct to Platinum via Togiak Alaska. Cylinder temperature and oil temperatures indicate hotter than normal as were flying over Togiak. Air temperature at 4500 MSL 23 F. Due to the alarming temperature indications we landed at Togiak. ADSB weather indicated winds at 10 miles 28 minutes prior to landing in Togiak. Checked the oil level, removed the oil cooler cover, added one quart of oil to increase the level to 7-1/2 quarts. Engine normally operated at or just above 6 quarts. Departed Togiak maintained 3,000 MSL following valleys to Platinum just in case the engine failed. Entered PAPM pattern, performed two orbits watching wind sock for gusts and wind direction. Wind direction approximately 080 degrees from centerline of runway 32. Entered final for runway 32. Encountered a few gusts, 5-10 degree crab into the wind. One notch of flaps, carb heat on, engine RPM 1500 until crossing runway threshold. Decreased engine RPM to 1100, right wing low, aircraft aligned with runway centerline. When flaring to land just as the airplane stalled for tailwheel and right main wheel first landing, a gust of wind picked the aircraft above the runway three to four feet. I drifted off centerline heading for the runway lights on the left side of the runway. I decreased left rudder deflection to avoid hitting the runway lights. Upon the second touch down another gust caught me causing the aircraft to weather-vane into the wind, full left rudder had no effect. I applied full power attempting to abort the landing. I didn't get the carb heat off as this all happened so fast. We crossed the runway into the airport construction barrow site, approximately 10 feet deep, 100 to 150 feet wide. It felt like the aircraft was airborne in ground effect. The far side of the barrow site angle of repose is 20 degrees or so. The right gear contacted/compress first on the far side of the barrow site causing the aircraft to ground loop to the right. Neither my wife or I were tossed about. My wife described the impact as landing on a soft couch. I should have aborted the landing after what witnesses called the first bounce.

RECOMMENDATION (How could this accident/incident have been prevented?)**Operator/Owner Safety Recommendation**

I should have aborted the first landing attempt after the gust sent us airborne as we were touching down. I could have made another attempt. If unable to land could have diverted to the Goodnews Bay airport. Winds were aligned with the runway. (Winds calmed a few minutes after exiting the aircraft.)
