Description of Damage to Aircraft and Other Property (Use additional sheet if necessary)

Keel tube of wing broken, one of three propeller blades broken. Nose brackets of wing deformed.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

At approximately 2100L I took off from Bradley Sky Ranch (BSR) to do some pattern work. Took off to the south for left traffic. Winds were out of the west at about 5 kts estimated by smoke on the surface & wind sock at about 45°. Aircraft experienced "active" flying at tree top level due to light loading & terrain. (In a trike the wind is experienced more acutely. Almost like turbulence but more just interaction with the aircraft & wind) While on upwind a Supercub joined the pattern and I became number 2. The Cub landed and I extended my pattern while he took off again. On short final as I came over the trees I experienced the "active" air again, which combined with the X-wind seemed to weather vane me to the right (west) upon touchdown. The aircraft required appreciable nose wheel control to return to centerline. Once recomposed on centerline I applied power and took off for a touch and go. Conditions were the same for the second landing and the Cub was now a close number 2, possibly adding stress. Upon touch down the Aircraft weather vaned right again. I applied pedal input to correct but it was ineffective. As the aircraft rolled off the runway surface the crown tilted the aircraft farther to the right. Aerodynamic inputs of the wing were added and at this time the front wheel gained traction, steered sharply to the left & the centrifugal forces caused the aircraft to tip over its gear, coming to rest on the leading edge. Damage was contained within the aircraft which was pushed to parking to remove from the runway.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Additional training concentrating on more ground handling
& cross wind operations.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☒ No Perhaps

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

The rake angle of the front gear causes it to be very
reactive. It is possible that reloading the front gear
with steering input caused it to react by steering
farther in the direction of control input. Research
into installing a steering damper will be made.
