Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

(SEE ATTACHED NARRATIVE)

We took off approximately 10:00am on 12/18/2016 in N121MR from Wolf Lake (4AK6), northbound into Hatcher's Pass with the intention of practicing off-airport landings. We had approximately 14 gallons, 1.75 hours, worth of fuel. Winds were light and variable, ranging from 3-8 knots, visibility was unlimited. It was a beautiful morning for a flight. We had no particular landing spots in mind; we were just looking for something interesting to check out. John Weis is a private pilot working on commercial rating. He and I had had a flight 2 weeks prior and his skills were so good I thought I would have a hard time teaching him skills he didn't already have. We saw one spot that was mainly a bowl with a spine. I had asked him to walk me through how he would land me on that spot if I were a client. He circled on his high recon and explained to me his thought process. I let him go through the entire process right up until the mid-approach point and said, "Can I show you how I would personally do it?" and I took flight controls. We circled 2 more times as I walked him through my thought process and how I would approach it. So then he took flight controls back. We executed and successfully completed our approach. We didn't touch down, but came to a hover over our spot, noting an approximate altitude of 4200 feet, then took off to find another spot. I remember thinking we should stay close to the road in case something happened. We went across the small valley in Hatcher's Pass and found a second spot to land on. It was a gravel spot in a saddle on a spine. We went through the same procedures/acronyms with a second successful approach and an actual touch down landing at an approximate altitude of 4600 feet. During his approach, he had pulled full carburetor heat like he had on the first approach. I pushed the carb heat back down and asked him to explain to me the proper use of carb heat per the POH as it pertained to available power usage. Once on the ground, I told John, "I'm going to get out and take your picture," because it was a really neat/beautiful spot to land on. I took his picture from 2 different angles and put my phone in my pocket which, normally, I fly with all pocket items under the seat. So we took off again and I remember pointing down at the fuel gages and saying we have time for 1 more landing then we need to head back. We crossed the valley again and spotted another potential landing spot. This spot was also a gravel spot on a spine and during our circling we agreed our escape route would be off to the right. We circled 2-3 times and then began the approach being in agreement everything was safe. When we were circling I remember noting the wind was variable and had dead spots. Everything was looking really good on approach. John was on controls, coming in nice and slow, disc loaded, on a shallow approach. I remember noting all gages in the green, warning lights out, his descent rate at 150fpm, and MAP of 20-21 inches. We got to about 10-20 feet off the surface, realized it was a steeper uphill grade and we could not safely land there. Right about the time I was going to say let's go around or abandon this approach, the low-rotor warning light and horn came on. This caught me by surprise and I remember thinking, "No way." My hands shot up to the controls and I said, "NO, NO, NO, NO!" But realized once we started sinking/settling we were going right to what was in front of us. I'm sure there was a slight struggle for flight controls, but it is hard to say. I remember pushing forward on the controls into the slope thinking maybe we could touch the skids and bounce back off to take our escape plan to the right. The toes of the skids hit first and then we plopped on the heels of the skids. I remember being fearful we would slide backwards. I pulled collective and pushed right cyclic. We shot back up, drifted slightly to the right and began spinning to the right, which seemed to intensify with each spin. I think we both put in full left pedal trying to stop the spin, but the centrifugal force was so great I remember feeling pinned. I felt us to begin settle/sink again as we were spinning and thought to myself, "We are going to hit and roll." The right skid contacted first on the uphill side stopping our spin. Then the left skid

came down and the roll to the left began. At this point I shut my eyes and braced for impact thinking, "We're dead." There was a big impact, then a roll, slide, impact, another roll, then a long slide. I remember waiting for it to stop but realized how high up on the mountain we were. I opened my eyes to see I was sitting upright in my seat sliding downhill facing forward. I reached across my body with my left hand, undid my seatbelt, and rolled (like a football player dodging a tackle) to the left. I then looked up hill and, to my relief, saw John standing upright above me. "Are you okay?" "Yeah. Are you okay?" we said to each other.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The biggest thing I've learned from this experience is

*Never shoot a practice approach to anything you're not 100% sure you could put the machine down on in the event of something happening in the last 25-50 feet. If the surface would have been a bit more suitable we might have been able to touch and come back up to take our escape route.

December 18th 2016 we took off from Lake 6 (Wolf Lake) to practice pinnacle landing between 4000 and 4500 feet. Winds were about 5-10kts. on our last pinnacle for the day we set up just like the others. High and low recons, observing the spot. After we deemed it safe we made our approach. All went well until about 4 to 5 feet from touch down. the low rotor rpm horn and light came on. I looked down and verified the gauge, which seem to be just about 90%. While robling on throttle and lowering collective i believe i tried to maneuver away from the spot to gain altitude. In the midst i believe our tail or right rear skid made contact with the ground and we yawed and rolled to the right, contacting the ground fully on the right side of the aircraft. Being a pinnacle the slope was very steep and the aircraft rolled a few times before David and myself were able to eject ourselves from the aircraft. Once out, the aircraft slid maybe 40 yards or so before coming to rest.
