Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Damage to outer left wing and aileron. Left side horizontal stabilizer and elevator. Fuselage has damage around the left gear box, right side upper just behind the wings is also buckles and rivets popped.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

We departed from Fairbanks PAFA airport, Departed on a 180 heading, received radar services until outside of the TRSA. ATC approved frequency change, squawked VFR and changed to frequency 122.9. Continues South to St George Creek, flew up the valley and proceeded to set up a straight in approach to land on the upper St George Bush strip. Briefed the passenger for landing, performed pre-landing check list. On short final winds were from my right side I corrected for a right side crosswind coming from approx 270 degree, wind was constant with no gusts or turbulence. Landed within the first Hundred feet of the 1000' strip, proceeded with a low tail roll-out. As speed diminished almost full left rudder was used to maintain centerline due to crosswind but was nothing unmanageable or unexpected. Began to apply braking, as speed continued to drop lower than needed to maintain rudder authority to stay straight I began to use strong left braking to maintain directional control, brakes felt good and was maintaining centerline without difficulty. Had a sudden failure of the left side brake, my toe pedal fell completely limp and "went to the floor". The airplane immediately started to drift right, full left rudder was held but was not enough to keep straight due to the crosswind. The plane rotated 90 degrees, weather vane into the wind and was skidding sideways upright on all tires. the left main wheel left the edge of the brushed out strip and hit the base of a bush. This suddenly stopped the skid and the momentum brought the plane over onto the left wing and left side of the horizontal. The Pilot side door did pop open on impact. Myself and my Son were the only occupants and neither were injured. The impact was very light. The engine and propeller continues to run and had not struck anything. I shut the mags off to immediately stop the engine, I shut down all power using the master switch, I turned the fuel selector to Off. We then exited the aircraft and I immediately went to the left main wheel to inspect the brake knowing something had failed. I found the brake line had separated near the lower part of the gear leg. The hard line had a blue compression style fitting that attached it to the flexible brake line that was attached to the caliper assembly, the hard line apparently had slipped out of the fitting. The area was wet with hydraulic fluid but no further fluid was coming from the detached line. I then inspected the rest of the plane and found severe damage to the left wing and horizontal stabilizer. The landing area is in the Alaska Range and no cell phone coverage is in the area. I used my InReach to message my wife and arranged to have a friend pick us up the next morning. It was determined that the plane was obstructing the runway and would not permit another plane to land. My son used a chainsaw to cut brush from around the plane and back away from the strip. We then spun the plane and backed it away from the strip. The plane was then tied down to secure it from further damage.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Mechanical failure caused this accident. These are machines and they will always be prone to unexpected failures. I inspect the brake lines on all pre flight inspections including this one. The brake line gave no appearance of looseness, leaking or movement. The aircraft had an annual performed 10.9 hrs prior and did not give any sign of failure. I think this is proof that machinery will have unexpected failures. I would advise all pilots to check brake lines every preflight but as this shows sometimes things just happen.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No*(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)*

Left side brake line separated under hydraulic pressure while heavy braking was being performed.
