Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Main gear legs and propeller departed the aircraft. Extensive damage to the nose section. Left flap damaged, right wing leading edge sheet metal damage (4 inch section), right wing lift strut dented and bent, and left elevator sheet metal damage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Initial departure the day of the accident was from 78AA in North Pole, AK. After discussion with FSS and Anchorage Center the night before regarding a local TFR, departure was delayed until the TFR was lifted. Weather was obtained through the Alaska Aviation Weather Unit website as well as reference to weather cameras available near the route of flight. Notams were checked using Defense Internet Notam Service (DINS). All information supported a flight under VMC to our intended destination in the Eastern Brooks Range.

The first leg was flown to a gravel bar on the Porcupine River for a short stop followed by continued flight to an unmarked, but frequently used landing area near the head waters of the Kongakut River to rendezvous with another aircraft. Total flight time was 3.6 hrs. After a couple hour break, the decision was made to continue down river to another area of sizable gravel bars for landing. Checked oil quantity and verified the fuel totalizer calculated fuel remaining of 34 gallons by use of a fuel dip stick.

Take-off was normal and a climb was initiated to approximately 5000 ft to loiter in the area as other potential landing sights were evaluated by the other aircraft. After a couple of orbits, the accident aircraft departed to the previously planned destination down river. Upon arrival in the area, winds were observed out of the north at approximately 10 mph with unlimited visibility and high ceilings (all peaks in the area were visible). Two patterns were flown over the area to observe potential landing sights and one location had been selected for further investigation. A left hand pattern was initiated with flaps at 20 degrees with the intention of making a low and slow pass over the location to search for any obstacles that might not be visible from a higher altitude. After rolling out of a left hand turn heading south, on a downwind leg at an estimated 500-800ft above the potential landing area, the pilot felt a loss of thrust. Wings were kept level and back pressure on the yoke relaxed to maintain aircraft control. The propeller was still windmilling, but not making power. The pilot pushed the mixture, prop, and throttle controls to Full Rich/Max in an attempt to restart. Still descending, an attempt was made to restart by pressing and holding the Emergency Fuel Boost Pump switch. The engine restarted and sounded like it was accelerating towards full power when the aircraft impacted the ground. After skipping across the tundra, the aircraft slid off of an embankment and came to rest in the brush. The pilot shut off the Master Power Switch and evacuated through the left hand door.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

This accident might have been prevented if the pilot had been able to more rapidly analyze the situation to recognize fuel feed as the likely cause of the mechanical failure. By the time fuel was restored, too much altitude had been lost and recovery was not possible.
