NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

On Aug 16, 2021, after conducting a standard pre-flight inspection for my second trip of the day, I fueled the Cessna Caravan, N97HA, and began an IFR flight from Fairbanks AK to Huslia, AK. Although on my previous flight back along this path I did not encounter any icing, upon reaching 9,500 ft on this leg, I noticed light rime ice less than 1/8 in. on booted portions of the wing, and not extending beyond the boot. The temperature was -1C and I was facing strong heads of at least 53 kts. Wanting to escape the icing conditions, I noticed a brightness in the clouds above me and thought I could climb out of the tops of these clouds. I then requested and received the block altitude of 10,000 to 12,000 ft from ATC to start a slow climb out of the ice at 125 kts using the autopilot. The aircraft felt normal with light occasional turbulence. Pitot heat, propeller heat, and stall heat were turned on and working properly. I manually activated the de-ice boots per protocol and they were effective in shedding ice. Per policy, I manually deactivated the autopilot to ensure the aircraft remained in trim on a regular basis.

While listening and talking with other pilots on company frequency, I realized the tops were much higher and winds were getting stronger. After hearing another pilot in the area get a lower altitude and experiencing less ice, I started back down to 10,000 ft with the use of the autopilot. I intended to seek a lower altitude, but ATC was quite busy at the time. During my descent I monitored airspeed using the autopilot without noting any abnormal flight characteristics.

Suddenly upon reaching 10,000 feet or slightly before, the autopilot disengaged with no warning or alerts; just the normal disconnect tones. I saw the autopilot had failed and the aircraft immediately entered a steep bank to the right and started an aggressive decent. It required the use of both of my hands on the yoke to regain control of the aircraft. During this time, I could not turn the yoke to the left to counteract the right bank. After a few moments, I reduced power and tried to get some trim to help hold the control pressures needed to keep the aircraft in straight flight. The ailerons remained jammed, but I was able to correct the dive and turn the aircraft back to Fairbanks by holding the aileron pressure to the left and standing on the left rudder and adjusting the power lever. I pulled the autopilot circuit breaker and reset in case I was fighting the autopilot without any noticeable change in conditions.

An emergency was declared to ATC and priority handling was given on the flight back to Fairbanks. The flaps would not engage on my approach, but the landing was accomplished on runway 2R without incident. All eight passenger and I walked off the aircraft and into the terminal on the east ramp with no reported injuries.
