NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I was flying in the Talkeetna mountains approximately 20 miles northeast of the Talkeetna airport. I was the only person on board with a small amount of survival/camping gear and 15gal of fuel. Weather was a high overcast of 4,000ft MSL or so with light winds. I located a possible landing area on a hillside at approximately 2,500ft MSL. The area was rocky tundra sloped slightly uphill on one side and downhill on the other. I made several passes over the area to try and note the best landing line and potential hazards. I noted that go arounds were possible and safe without concerns of terrain in the direction I intended to land. The landing area appeared to be about 500ft of good surface that sloped upwards and then leveled off and started downwards into a rougher, but still safe runoff area of a few hundred more feet. I noted an area of larger rocks slightly to the right of my intended landing path in the runoff area that I would try to avoid if I ended up going into the runoff area. I made a final pass and dragged the wheels on the surface to test it and the general feel of the spot. The wind appeared to be a light quartering headwind. In all it appeared to be well within the capabilities of the aircraft and myself and similar to hundreds of other successful landing areas. I came around again and lined up for landing. I touched down properly, but slightly past the ideal spot. I applied a normal amount of brake, but the aircraft appeared to be slowing down slower than I would have expected. I got to the top of the rise and started to go downhill. The aircraft was quite slow by now, but the correct decision would have been to go around at this point. With the slope, the lightly loaded plane would have been flying again very quickly with application of power and I had already verified that there were no obstacles hindering a go around. However, the overconfidence of having landed in many similar and more difficult places without issue definitely played a part in the decision to try and keep the plane on the ground at that point. As the plane slowed it started to weathervane slightly to the right into the wind, which was more of a crosswind than I determined from the air. Attempting to avoid the rocks I noted earlier, I corrected with brakes, which happened to coincide with rolling into a large hole I had not seen from the air. The aircraft was going very slowly by this point, but the hole, combined with the downhill slope, brake application, and light weight of the aircraft caused it to begin to nose over. I released brakes, but it was too late and the aircraft went up on the nose and then possibly because of the slope, continued to flip over. In my estimation the cause of the accident was pilot error caused by poor choice of landing location combined with overconfidence in continuing a landing that should have been a go around. There was a small contributing environmental factor of the crosswind although that is also a judgement error in not correctly determining the potential effects of the crosswind on the chosen landing area. The aircraft was in airworthy condition at the time of the accident and there were no known mechanical failures.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The only possible prevention would have been a more cautious examination of the spot and more willingness to go around in a less than ideal situation. I don't believe that any industry wide changes would have made a difference in this particular accident.
