OAT 15 C light winds 3-5 KTS out of the south west, up wind from the reservoir on the EL Cap site

Conducting an initial 205 check on a company pilot in the El Cap valley, using the triangle area for touchdown and hover area.

We started with upper air work 60kt turns left and right 360's. We then shot an approach into the triangle and worked with several approaches. We then conducted hover exercises in basic control followed by several touch downs and pickups, including aft cross tube placements over a small animal trail. We did a confined area to a small pinnacle next and the trainee was coming along with good control and responding to my comments well.

I decided to then transition into hydraulic failures detailing the loss of hydraulic boost to the pedals and collective, demonstrating each in a hover to touch down. We flew hydraulic failures in the circuit to touchdown both system #1 and then system #2 were to the triangle area.

We then transitioned into power chops in the hover, starting low then working higher into a high hover, a total of 5 were conducted. We moved onto a brief discussion on stuck pedals in the hover and demonstrated 3 to the left and 2 stuck right with a reduction of the throttle to touch down. I did notice on one of the roll ups that the engine did accelerate more aggressively than normal, as if both, myself and the trainee had been accelerating the throttle at the same time. The torque went up in the 30's, I caught it with the throttle and reduced the throttle to idle. Looked over to the trainee and it didn't appear that he had accelerated the throttle, I apologized to him as I thought I was being aggressive on the throttle and I had told him to accelerate the throttle previously from 10-20 torque on roll up.

I then went to demo an auto and I asked the trainee to follow along on the controls. The first auto I demonstrated from a higher altitude so the student gets a better feel for the aircraft and can see how it responds and feels. We were at 2500 ASL or 1500-2000 feet AGL. We entered the auto I reduced the speed down from 90 to 70, and checked that the NR rotor was in the green, it was in the bottom of the green and it appeared that the N2 was not split but in the bottom of the green, I confirmed that the throttle was against the idle stop and the N2 dropped down to 75. I looked outside and realized that we were high and were going to be long past our intended spot, I did a 360 turn to the right to make sure the information on the dash was correct (I knew that there were clear spots short of the triangle area as well) and to attempt to accelerate the engine, in the turn I advanced the throttle and the engine did not accelerate on the gauge, it was indicating even lower at this time to around 50-60% N2 and I did not hear it accelerate. The NR also did not accelerate when doing this. In the turn I realized that the engine really was not coming back and accepted the terrain below with low bushes as my spot, I also noted in the turn that I was at 92% NR so I flared to build as much rotor RPM and stop the helicopter to touched down. On touch down the helicopter rocked forward and back on its skids. I looked at the trainee and asked if he was Ok. I turned the throttle down to flight idle. I then asked the trainee to confirm that the throttle on his side was above the idle side of the detent, I checked my side and it was above on the stop as well, I instructed the trainee to push the idle detent button and I shut the throttle off on my side it responded as expected and traveled to the off position. I believe the engine was running at a reduced RPM on the ground. We confirmed that the governor and fuel valve were in normal and on positions. We turned the battery off and exited the aircraft.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Creating a policy that during autorotation training with pilots, we shall always have a firm level surface that is large, specifically a hard surfaced runway to practice to ensuring if this happens again, there will be a good surface to perform the landing on.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☐ No*(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)*

This is under investigation at this time. The engine is going to an engine shop for investigation.
