Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left wing tip cap and upper surface skin buckled, left aileron damaged and dislodged at outboard hinge, lower engine cowl contact damage, propeller damaged, right wing tip cap bent and skin buckle. Windshield previously damaged, and further damaged during recovery.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I overflew the Godin airstrip (Private) at 700 msl, at 90 kts and gauged the surface winds to be less than 10 kts from the SE. I then entered a left downwind leg, adding 1 notch of flaps while slowing to 70 kts. I completed a before landing check of fuel - both wings full, fuel selector - both, undercarriage - fixed, parking brake - released, mixture -full rich, power was reduced to approx. 1700 rpm and applied carb heat. I initiated a left descending turn to the base leg, adding 2nd notch of flaps while slowing to 60 kts. I intercept a shallow approach angle over the water and executed a dogleg final approach while continuing to descend to avoid overflight of adjacent shoreline housing, added the 3rd notch of flaps while slowing to 50 kts. I detected a bit of a right crosswind component on final, added right aileron and maintained runway heading with pedals. On short final, the aircraft began to drift slightly left of centerline. I added the last notch of flaps at approximately 40-50 feet and added power while descending below the trees to the left front. I was behind on my correction to add power and the aircraft began to stall and yaw tail right, left wing low, and nose low. I resisted adding full power due to my proximity and angle to the trees and added right rudder in an attempt to level the wings before the left wing struck the water and vegetation nose low, coming to rest in approximately 4 feet of water, on the main gear. Upon water contact, the engine and propeller stopped abruptly. The aircraft came to rest at a right angle to the runway and the remained upright. I turned off the mixture, magnetos and master switch. Water was beginning to enter the floor of the cockpit and I opened the door left door normally. I listened for the ELT, and hearing none, exited the aircraft and walked to the shoreline. I did not sustain any injuries, and sought no medical treatment, remaining on scene to assist with the recovery of the aircraft from the water.

The aircraft remained intact with no debris field or post crash fire.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I had taken off and landed at this strip only once prior to this incident, while solo. I would have benefited from dual training prior to pressing a tailwind approach and landing. I got behind the aircraft in making a heading correction at a critical phase of landing, after descending below my barriers, while the airspeed continued to slow, allowing the aircraft to stall without a recovery path or sufficient maneuvering speed.
