Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left wing damage: bent tubing along the tip, broken forward and rear spars, a few bent ribs, leading edge damage at the strut attachment, bent trailing edge near fuselage, bent aileron trailing edge, wrinkled/torn fabric

Right wing damage: cracked rear spar, bent tubing on wing tip, minor fabric damage to trailing tip, 4 or 5 tweaked ribs

There was no damage to the prop, fuselage, tail or landing gear and no property damage or personal injury.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The purpose of our flight was to bring family commercial fishing crew members to and from Chisik Island to operate the fish site. The plan was to depart Kenai at 6:30pm drop off one, return to Kenai with another one and then bring another back to Chisik where 3 of us would stay to fish. On the first leg from Kenai to the island we approached the Northeast beach from the Southwest for a low pass to inspect the landing area checking for debris the tide may have washed ashore, and to confirm the tide was low enough to land safely. After determining the landing area was clear, we circled around to land. After touching down and establishing directional control, my focus on rollout was keeping the airplane a safe distance from the water on our right side while keeping an eye on the terrain up the beach on our left side where there are various washed up logs, sticks, tree roots, etc. There are two upended tree root systems to watch for that I was aware of from past beach walks, taxis, take-offs and landings and I had them in sight as we were rolling out. After passing by the first one, I picked up the 2nd, determined that we were safely more than a full wing span from the water, but pretty tight to the tree, so I let the airplane drift to the right a bit judging that we would have clearance on the tree. The landing roll was just about finished, the tail was not flying anymore, and just as I was about to apply the brakes, the left wing tip hit that 2nd upended tree root sending us into a ground loop which caused the right wing to then brush the beach. The impact to us was very minor so I immediately knew there were no injuries. There was no prop strike so I pulled the mixture, shut off the fuel, turned off the master and got out to check for fuel leaks. Seeing none, we began assessing the damage to the airplane, and then I called home on the satellite phone to report what had happened and communicate our plans for securing the airplane and making our way to the fish site. The tide was dropping so the airplane was in no immediate danger, but it was partly within the tidal influence so after recording several pictures and a video it had to be moved. I am confident it could have moved under its own power, but we had access to a 4-wheeler, so we elected to tow it down the beach to where we had been tying it down and secured it there.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

In retrospect, there was plenty of room to land, I fixated too much on staying safely away from the water instead of just staying on the "centerline" of the landing area and keeping it straight. I should have just touched down, maintained center and got right on the brakes to minimize the rollout.
