Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Ground loop and nose over caused damage to both wing tips, bent the right wing strut, and damaged horizontal stabilizer and elevator. All blades of the composite prop splintered from 6 inches out of spinner/hub. Further damage to be determined upon inspection.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

We landed at Jake's Bar the previous day and spent the night in the public use cabin. Saturday morning, we departed at approximately 11 am that morning for a day trip to McCarthy. We refueled in McCarthy at 12 pm and departed at 7:45 pm. McCarthy WX VFR, winds 270 @ 5 knots. The 15 NM flight to Jake's Bar was normal. I flew over the west end of the strip to assess winds.

Wind at surface appeared West at 5 knots (though no wind sock on ground), and wind at 2000 ft MSL (pattern Alt) confirmed my assessment. Field elevation at Jake's Bar is 1074, but it is in the crook of a bend in the Chitina River that carves a narrow, 400-foot valley into the surrounding plateau. The surrounding terrain is a level plateau approximately ½ - 1 mile each side of river valley at 14-1500 MSL, then slopes up steeply to 3-4000 feet. The Chitina River is a fast, cold-water river, accelerating into the bend.

I flew a normal, left pattern. On short final, I sensed the expected headwind had shifted to a tail wind. It carried me past the intended touch down point. Breaking was poor on the river rock surface. Near the end of the strip, I attempted the ground loop to prevent rolling over bank, but the left wheel hit large rocks and nosed over off the edge of the runway surface and inverted with the tail sloping towards the river.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

As per AK Supplement page 167: "Recommend visual inspection prior to landing. Subject to turbulence in any wind." A windsock on the field would be helpful.

But: A longer inspection, wider pattern, longer final leg may have revealed the changing wind from 500 feet AGL on final to ground level.

Ultimately, a go-around should have been initiated when the wheels first touched down past the intended point.
