Subject: Toxicology Report
Contact: Turan Kayagil / Chief Medical Officer

The FAA medical case review confirmed that the 58-year-old male did not have a pilot certificate and had not applied for FAA medical certification. His postmortem toxicological results included delta-9-THC (the primary psychoactive substance in marijuana and other cannabis products) and its metabolites. The results indicate that he had used a cannabis product and may have been experiencing associated impairing psychoactive effects at the time of the crash. However, it is not possible to determine whether this was a factor in the accident, particularly given that he did not possess the baseline skill and experience to safely conduct the flight.
