Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The aircraft flipped over on its back. All major portions of the aircraft (engine, fuselage, empennage, and wings) were significantly damaged. No damage was done to other property as the aircraft flipped over in the gravel/grass on the edge of the runway.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

This flight was planned to be an instructional flight in the vicinity of the airport with a focus on takeoffs and landings. The student lined up on runway 23 and applied full throttle. Upon the tail of the aircraft coming up, our nose went to the right (a supposed overcorrection of the gyroscopic forces involved with raising the tail). We were I'm guessing half way between the centerline of the runway and the right edge of the runway. The aircraft then made significant turn to the left (possibly an overcorrection trying to get the airplane back to the centerline). We were now heading diagonally across the runway toward the left side of the runway at approximately a 45 degree angle. The tail was up, and in this aircraft once the tail is up, it is almost ready to fly. I did not get on the controls at this point - wanting to let my student straighten up the airplane on his own. The aircraft did not straighten up, and with the edge of the runway approaching - I decided our best option was to simply get the airplane airborne and fly off the runway at an angle. At this point I reached down and grabbed the stick and pulled back, bring the airplane into the air. At about this same time - the throttle - which was in the students hand - went to idle. I am estimating we got as high as 5 feet in the air. We came down quickly and landed with a good deal of side load on the right main landing gear - which (upon later inspection) stripped the nuts holding on the tire, and the tire departed the airplane. There was a rubber mark on the runway where this happened. We bounced back in the air at that point and went maybe another 30 feet, where we came down in the gravel about 5 feet off the edge of the runway. The right gear - now without a tire - dug into the gravel and the airplane flipped on its back. The student and I safely exited the aircraft with nothing but a few scratches and bruises. The right main tire was found approximately 500 feet down the runway.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

This accident could likely have been prevented had I the instructor taken full control of the aircraft instead of partial control. When I made the determination that the aircraft was not straightening up on the runway and that our best course of action was to get the airplane into the air and fly off the runway at an angle - I should have instantly taken full control of the aircraft (stating 'my controls'), which would have included grabbing the throttle and keeping it pushed in at full throttle. I believe had I done this, we would likely have flown off the edge of the runway without incident.
