Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Damage to both wings. Left wing struts bent. Right wing appears to have nose rib damage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

At approximately 2:15pm I arrived at my aircraft and performed my standard pre-flight checks. I sumped fuel from both wings and gascolator. I dipped both tanks for quantity and verified there was 6 gallons in each wing. I started the engine and warmed up for approximately 10 minutes and the engine behaved as normal. After obtaining weather from the PATK ATIS, I taxied to runway 19 and was waiting number 3 for departure. I performed my run up and everything checked out including magneto drops and carburetor heat check. I verified I was selected on the right fuel tank and departed runway 19 at approximately 2:44 pm. The take off roll and lift off felt as expected and I performed a VX climb. When I was approximately 300' AGL I noticed the engine was dropping RPM down to 1500 and then back to 2400 RPM and it did this 5 or 6 times. During that time, I verified that I was selected on the right wing fuel tank and at that time the engine quit and I was only focused on flying the airplane at that time. I had already made the decision to turn left back towards the airport as I knew there is large swamp on that side of the runway. If I had gone straight I would have ended up in the trees to the South of the runway. As I pushed the nose over and started my turn I gave a radio call stating "032 returning to runway 01." I made sure to not stall the airplane and when I was approaching the ground I realized I was not going to make the runway so I flared and got the plane as slow as possible upon touching down on the snow. I made it approximately 40 yards on top of the snow according to my tire tracks and as I came to a stop the wheels dug in the snow and the plane flipped onto its back in slow motion. I immediately unbuckled my shoulder harness and made sure that I could get out of the door which I was able to. Once I was out on the wing, I reached back in the airplane and turned the fuel off. I also made a radio call that I was uninjured and then secured the airplane turning off the master, mags, avionics, and all switches. Some bystanders came over to make sure I was alright and shortly after the EMS/Fire Department and airport manager showed up. I was uninjured and refused medical services. About an hour after the incident, some friends helped flip the airplane back over and towed it back to its parking spot. My intended destination was PATK and I was only going up to fly a few patterns to warm up the oil and perform an oil change.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I stand by my decision to quickly think about the best emergency landing area and that was to turn back towards the swamp near the airport. I am not sure why the engine had difficulties and quit making power. I am not sure what I could have done differently in this emergency situation that I thankfully came out from uninjured.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)

Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

The current theory from mechanics I have spoken with is a fuel flow / contamination issue. Once the investigation is completed there should be more clarity.
