Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Prop strike, bent engine mounts, deformed left wing (spar conditions unknown), bent lift struts, damaged rudder and vertical stabilizer.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I checked weather via NWS, Windy app, and Foreflight to acquire as much weather information as possible. I departed Birchwood Airport at 0900 to fly to a hunt area approximately 61 nm SSE of McGrath. After passing Puntilla Lake, I was able to ascend to 7000 MSL to clear the mountains and headed directly toward the destination. After descending over Big River, I experienced significant clear air and obstruction generated turbulence. Upon arrival over the landing area, I made one low-pass to check wind direction. A flag at the site indicated 10-15 knot cross-winds. I made two landing attempts from the SE, where I was crabbing significantly into the wind and experienced large up-drafts that caused glide-path deviation, causing me to have to go-around. I decided to change my approach direction 180 degrees out of the NW. On this approach, I experienced much less turbulence and cross-wind than my SE approaches. The plane seemed to be on a stable approach path, with stable airspeed approximately 10 knots above stall speed. I flared and touched down in a good location near the very NW end of the strip. With the wheels firmly on the ground, I pulled the engine throttle to idle. As I began to roll out and slow the airplane down, I rolled through a dip in the runway sloping to the right. I also received several gusts of wind from the left. The combination of these factors moved the airplane to the right, where the right main wheel began rolling through soft tundra with tussocks. There was no cargo weight, (including the back seat) in the airplane and the wing tanks were holding approximately 55 gallons of fuel. The added drag on the right tire caused the airplane to begin to rotate forward. The rapid deceleration also forced me forward into the rudder pedals and I inadvertently applied brakes. As the nose rotated downward, I pulled full-aft on the elevator, but the controls did not arrest the forward rotation of the nose. The prop, now at idle, began contacting the ground and struck the ground approximately 5 times before the airplane fully nosed-over and flipped onto it's top. I estimate the airplane was traveling approximately 20 knots when it flipped onto it's top. After coming to rest, I turned the master switch and magnetos and fuel off, released myself from my harness and exited through the left-side window.

I was able to then utilize a shovel that was close by to dig a hole in front of the nose and several other people close by assisted in flipping the airplane back onto the landing gear.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

This accident could have been avoided by more careful consideration of personal minimums, and by not attempting a landing in cross-wind conditions that were close to the maximum capabilities of the aircraft and pilot.
