Description of Damage to Aircraft and Other Property (Use additional sheet, if necessary.)

Left wing tip damage including aileron, left gear box collapsed.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Pilot and Copilot, both qualified in the 185 were headed out for wheel proficiency flights. Copilot was in the right seat and Pilot was in the left seat acting as PIC. The two left from Lake Hood and copilot completed the first landing to a full stop at another airstrip. Pilot wanted to go to Goose Bay where there was a 3,000 foot runway to get proficient with landings. The plan was for pilot to do landings first and copilot to follow. Together they evaluated the winds together off the water and windsock as the pattern was empty with no other traffic. They entered the downwind entry which was normal and base to final legs were stable. There was about 5 knots of wind down the runway they were using 26. With 3 notch of flaps in and holding the approach speed well, pilot patiently waited for the wheels to touch in the wheel landing attitude and pinned the wheels on the ground with a normal wheel landing. The power went to idle right at touch down and the tail was kept in a wheel landing attitude during the roll out. Pilot's plan was to let the airplane come to a stop and reconfigure the aircraft: open cowl flaps, re-trim, and flaps to 10 degrees. Pilot brought out the flaps and waited for the airplane to slow with no braking applied. The plane had a slight pull to the left, which pilot then corrected with right rudder. At this time, the nose begun to swing to far to the right past centerline, which was not corrected soon enough, as tail swung with momentum to the left to spin the plane 180. As the plane swung into the runway edge lip with the left tire, the plane came to a rest with the left gear collapsed and tip of leftwing in the gravel. Fuel shutoff valve was pulled out, master off, mags off, and the two got out the right door immediately. This occurred at 5:20pm Saturday. After the two contacted help, it was verified the ELT did not get set off. There was cell phone service to communicate with others for pick up. 6:45pm the two crew were picked up by friends and a spouse at the same runway Z40 and returned to Anchorage. No one was injured.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

Factors that could have effected the outcome of this situation:

- Pilot was wearing extra tuff insulated boots for safety however that could have effected feel of rudder pedal and brakes. Tennis shoes should have been worn for better feel of controllability
- Pilot could have applied gentle braking immediately on touch down and brought the tail down to complete the landing. Letting the plane naturally slow and increasing the time of the roll out at a slower speed, decreased rudder authority
- Pilot could have given a more aggressive left rudder/brake when the plane was over corrected to the right to bring the plane back towards center line
- Pilot could have given a little power prior to overcorrecting to get airflow over the tail to get increased rudder authority
- Pilot who had not flown this plane in 6 months, could have asked co-pilot, a CFI, for additional support during the initial landings
- Had the plane had larger tires than 850s, possibly the plane would have rolled over runway lip rather than collapsing of gear
