Tailwheel time: 2000 hours

Tailwheel takeoffs and landings: 7000

Takeoff runway 03 at A8 intersection. Had flown previously during the day and prior days. I would characterize the wind as coming from a predominant direction but extremely variable in direction and velocity on different sections of the airport depending on localized convective and thermal activity due to solar heating. Multiple takeoffs and landing in the days prior where the wind socks were in major disagreement with the prevailing wind call from the tower and even saw windsocks showing varying wind conditions on different parts of the airfield at the same time. Looking at reported wind history bracketing the incident, the wind was reported variable Between West to North between calm and gusting 26 knots. At the time of the incident, the tower wind report favored a departure on runway 03. As takeoff was commenced there was a violent left yaw like never experienced before. Full right rudder and wheel brake were adequate to stop the left yaw but not enough to bring the longitudinal axis of the aircraft back in line with the runway centerline. The decision was made to abort the takeoff as continuing would have resulted in a more dangerous situation. The aborted takeoff resulted in a ground loop and wing tip damage. Post incident after exiting the aircraft I observed a strong gusty wind from the West/Southwest at my location and on the windsock on the runway 03 approach end in the vicinity of where the takeoff was commenced. The local windsock indication may have even favored a runway 21 takeoff and I perceived that it resulted in a strong left quartering tailwind. I believe this wind again was the result of local conditions due to strong convective thermal activity on and around the airfield. These local conditions may have not been apparent at the wind sensor location. Complicating factors were the large vertical stabilizer surface area on the Cessna 180J for the left crosswind to act upon and the compounding left turning tendencies of slipstream, engine torque and gyroscopic moment that overpowered control authority. The high density altitude may have also been a complicating factor.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I was not able to perceive this hazardous wind prior to commencing the takeoff however I will be much more vigilant in the future looking for signs of the variable wind during these environmental conditions and/or may choose not to fly when these conditions are present or are a potential presence. Regardless, the responsibility lies with the pilot in command to maintain aircraft directional control and the ultimate causal factor is my inability to that in these conditions.
