Description of Damage to Aircraft and Other Property (Use additional sheet, if necessary.)

Plane on back. Broken front window, Front fork and wheel sheared off. Cowling pushed up, engine appeared to have been pushed up slightly. Doors not able to close properly. Some damage to avionics, Propellor bent. Interior damage minor. Somer wong and tail damage but unable to fully ascertain.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Overall flight plan: Kodiak to Soldotna to Cordova to Yakutat. Refueled with full tanks, 100LL at Kodiak and Soldotna plus 10 gallons reserve. Refueled Cordova with the 10 gallons of reserve. Sumped, checked oil. Left Cordova 5:30-6pm

Flight uneventful. Plane performed well and set up for IFR panel with Forelight back up, synthetic vision and a full set of survival gear.

Flight levels 1500-5000', viz 3-10 miles, broken, multilayered clouds, moderate winds. Some light icing higher at 5.5k' and temps high 30's. Tail wind from Cordova for the first 45 minutes then cros wind and last 15 minutes head wind.

Itinerary was initially to get to Yakutat before nightfall. But head winds, end of afternoon, need for reserves etc I made the decision to land earlier at 19AK out of caution.

Decended from ~1000' under the flight deck to land at 19AK. At ~500' strong winds blowing in over the dunes. I lowered for the last 1-1.5sm to 200' to avoid the strong cross winds and buffeting. About a mile from the strip engine quickly lost power. Matter of 3-4 seconds from 2300-2400 RPM on final to zero RPM.

No engine hesitation, no hiccups (lies water or ice), no rough running, no different noises, no indication at all. Its sounded like the engine running out of gas. A smooth and consistent lowering of the RPM.

I had an indicated 16 gallons aboard (new electric fuel guages) and had just refueled, checked levels and sump checked. No water in fuel. Fuel levels as anticipated.

On engine rpm decline, checked fuel switch on "both", throttle full forward, mixture in, carb heat out, and primer hard in and secure. No response. I had 10 degrees of flaps in preparing for landing, left them the same. Diverted 45 degrees from over trees to the sand dunes and pulled hard to get over the last trees and mush it in to lower energy as much as possible. Front fork hit the bottom level of the sand dune and wheel pushed back, collapsed then nose rotated forward, prop hit ground and stopped, and momentum cause plane to rotate over the top and land on its back.

Immediately unbuckled, got fire extinguisher out, turned off master/lights/throttle out/ lights off, key out. Called search & rescue.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

Waited until better weather. Flown at a higher altitude.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Unsure of reasons for fuel or air starvation
