NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State time and point of departure, intended destination, and services obtained.

The flight departed normally from KIKW at 4:25pm on July 16, 2014 on Runway 24 followed by a climb to about 500 feet AGL maintaining the runway heading. The final intended destination was KMOP. The climb continued after turning left toward the private runway approximately 3nm at 217 deg from IKW. The private field landing strip is situated in an east west orientation. A landing toward the west was selected based on the wind conditions reported at KIKW. Flying crosswind at approximately 1000ft agl over the west end of the airstrip gave a good view of the airstrip environment. Left traffic pattern was flown in a conventional manner. On short final, airspeed was kept to a minimum to effect a short field landing. As the aircraft cleared the trees on the approach end of the runway, a significant sink rate developed possibly caused by the reduction of headwind near the ground. Application of power was insufficient to arrest the descent rate. The aircraft, having conventional gear, struck the ground with the main wheels headed straight down the runway on the centerline in a level attitude. Observing the wheel track after the accident, the main wheels appeared to spread apart and sunk into the ground far enough to scrape the sod with the brake calipers. At the same time, the propeller left several scrape marks in the turf perpendicular to the direction of travel. The wheels then returned to their normal position raising the aircraft back to a normal height. The aircraft then tipped forward on the nose and flipped over onto it's back pushing the engine toward the firewall and damaging the engine mount and firewall. The aircraft came to rest inverted resting on the top of the wings and the vertical stabilizer. The wreckage was contained mostly intact except for the VOR antenna that was mounted on the belly of the aircraft and one of the cowl doors. The VOR antenna was located near the initial point of contact and the cowl door was about 2 feet east of the aircraft. The aircraft came to rest with the wings perpendicular to the length of the runway. The front of the aircraft was pointed toward the approach end of the runway.

The runway is about 3500 feet long and is turf in excellent condition. The runway clearing is about 100 feet wide with 40 foot trees surrounding the runway on all sides.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Fly final approach at a higher speed increasing that speed as appropriate for the possibilities of a change in wind speed as the aircraft descends toward the ground or other obstacles.
