Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The area from the tip of the propeller spinner to the middle of the fuselage, including the wings, is bent, buckled, warped, torn or has some other form of damage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I took off from 3AU at about 0800 Saturday the 16th of August. I flew to a local grass field named Butler Airpark. I made 4 full stop landings there. I took off from there and flew to another grass strip named Brady Pipin. I made one full stop there, took off again and headed to another local grass strip. I made one full stop and headed back to Augusta, (3AU). The sky was clear with visibility in excess of 20 miles with no clouds. Before entering the traffic pattern at 3AU I noticed a beach bonanza taking off from runway 18. I made the entry for a left downwind to 18. From abeam to touchdown, everything was normal for the conditions. The winds appeared to be from about 200 degrees about 8 to 10 knots, and varying to the left side of the runway. On final there did not feel to be any great degree of cross wind. The landing was made with tail low to achieve a full stall. I bounced the aircraft. I do not know how high, but at the time it did not feel excessive and so I held the attitude to bleed of airspeed and settle to the runway. After touch down I cannot recall what caused the veering to the left or if I attempted to make corrections. What I do remember is that I thought to go around and then decided not to attempt because the possibility of making the aircraft's attitude worse and possibly flipping the aircraft over. I remember going very slow, as if things were in slow motion. I was not frightened and decided to allow the aircraft to make its own path to a stop. From the time that I decided not to go around until the aircraft stopped, I don't recall anything. I don't know if the aircraft rotated around its vertical axis or not. I don't remember the wing tips hitting the ground. The next thing I remember is hanging in the shoulder harness straps with the aircraft in a tail high, (60 degrees), nose in the grass, almost wings level and 10 feet east of the edge of the runway in the grass, with fuel leaking from the wing tanks vent tube. I turned the battery switch off and exited the aircraft normally-that is through the doors standing normally.

There was only one part of the aircraft that separated from it. It was a cowl latch. The dirt and grass had very little damage. The runway showed a tire skid for the right main gear. The skid mark is about 100 feet long and veering to the left at a shallow arch. The right wing tip shows scraping but not bending. The left wing tip shows large amounts of buckling. Within 5 minutes of exiting the aircraft an airport employee showed up and called the Augusta police for us. The fire department also showed up. There was no fire and no chance of having a fire. There was no damage to the humans.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I believe part of the reason for this accident was a lack of focus. I might have lulled myself into a feeling of over confidence. Instead of remaining focused on the landing, I might have lost concentration and mentally proceeded to another task such as where exit the runway. For me, practicing more frequently and in more difficult condition will increase skill levels to where I might not get myself in the condition I was in. Also, discussing this landing with a very experienced tail wheel pilot will, possibility, help me get out of the conditions that caused the accident.
