**Description of Damage to Aircraft and Other Property** *(Use additional sheet if necessary)*

Aircraft destroyed on impact. Right landing gear and radar pod separated. Wing spar bent. Puncture holes in fuselage. Both wings damaged. Major structural damage.

**NARRATIVE HISTORY OF FLIGHT** *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The accident occurred during annual insurance-required recurrent training provided by a CFI/IA to a student with a commercial certificate and instrument rating. Conditions were VMC with unrestricted ceiling and visibility. The maneuver to be practiced was a simulated engine failure on takeoff, with - after the simulated failure - a 210 degree turn (slightly more than 180 as the nose should be pointed at the runway 03 numbers) to return to the take off point and land downwind on the reciprocal runway. The takeoff occurred without incident. On the upwind leg, at 1200 AGL, I announced "simulated engine failure", and first retarded the power control lever and then pulled the prop control aft to feather the propeller. The student pilot initially (and appropriately) lowered the nose to reduce deck angle and prevent airspeed decay. The student then appropriately rolled into a 45 degree banked turn to the left, and pitched up to maintain 90 KIAS (best glide speed). When the nose was pointed at the Runway 03 numbers (aircraft on an approximate heading of 000 degrees), the student rolled to wings level and the aircraft proceeded - gliding - towards the runway threshold. As the airplane got closer, I became concerned that the sight picture was not "normal" for this maneuver. We appeared to be lower than we should have been. Nonetheless, I thought the maneuver could be continued successfully. The student said, "I think we're going to need power". I responded, "No, we're OK". It was about this time that I had my last look at the airspeed indicator, which indicated 90 KIAS. After another 10 seconds, we were over the runway threshold at approximately 40 feet. Though I still believed that the maneuver could be completed successfully, I decided it would be safer to abort the maneuver. I announced "I have the controls", and my student responded, "you have the controls", and I became the pilot flying. I immediately advanced the power control lever and simultaneously raised the nose slightly to arrest the descent. However, I felt no thrust from the engine, and the airspeed decay caused by the pitch up caused, within 2 seconds, the aircraft to stall and fall from an altitude of approximately 30-40 feet (estimated). As the airplane had not been aligned with the runway heading, but was on a heading of approximately 000, the aircraft struck the runway environment, with the right main gear contacting the runway, and, on impact, separating from the aircraft. I believe that left main gear contacted the grass and dirt adjacent to the runway and remained attached to the airframe. I estimate the aircraft impacted the runway environment within 500 feet of the threshold. The aircraft slid off the runway into the grass and dirt adjacent (on the north side) of the runway. With one wing was dragging, and the other on its landing gear, the asymmetrical drag cause the aircraft to spin approximately two revolutions. The aircraft stopped within 10 seconds of impact. When it stopped, the student asked, "are you OK?", I said, "Yes, are you?" He said, "Yes". The engine was still running and i pulled the condition lever aft to cut fuel flow to the engine. The engine then shut down. The top half of the clamshell door was operable, though the bottom half could not be opened. We exited by climbing over the bottom half. There was no fire or apparent fuel leak.

Two things stand out as I review the sequence of events in this accident. First, I have no memory of advancing the prop control lever as I added power. Although, post-accident, when I looked into the cockpit, the prop control had been moved forward, I have no memory of doing this and it remains possible that I added power when the prop was feathered, explaining the lack of thrust. Secondly, neither the instructor or the student remembers lowering the landing gear, though we verified "3 green" as we approached the runway. It is therefore possible that the landing gear had never been raised after takeoff, degrading climb performance and explaining the low altitude of the aircraft upon reaching the runway threshold (normally the maneuver should have placed us over the threshold at 200-400 feet AGL).

In my opinion, the cause of the accident was the instructor pilot's failure to maintain adequate airspeed and the resulting subsequent loss-of-control of the aircraft. A contributing factor was the instructor's failure to terminate the maneuver until there was insufficient altitude and energy to successfully abort.

**RECOMMENDATION (How could this accident/incident have been prevented?)**

## Operator/Owner Safety Recommendation

1. The training value of this maneuver does not justify its inherent danger. I now feel it should not be practiced except at altitude, noting net altitude loss, but concluding well above the airport.
2. If the maneuver is done, the prop should not be feathered. a zero-thrust feathered engine should instead be simulated by reducing torque to approximately 150 lbs. This would allow thrust to be more rapidly available if needed.
