Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

During the accident both main landing gear were knocked out from under the aircraft. The left wing bent and mangled. Prop blades bent. Tail section bent.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

At approximately 1:00 pm on August, 5th 2015 I began loading this AT-401 with fuel and chemical to begin a spray job requested by a local farm. My primary load man was not around so I loaded myself, which I ordinarily do not do. With the engine off and the park break set I proceeded to load approximately 360 gallons of chemical and water along with approximately 3/4 of fuel (about 94 gallons). After the I loaded my aircraft I started the airplane and allowed it to warm-up at idle for approximately 15 min to allow the oil temp to reach operating temp. I taxied to the beginning of the runway and performed a run-up which I normally do when the airplane has been sitting idle for a significant amount of time. I did not notice anything unusual during the run-up. I accelerated the throttle to 2,000 RPM and did a magneto check. Both mag drops were satisfactory. I then reduced the RPM to 1,400 RPM and cycled the prop 3 times. During this I noticed both a drop in oil pressure and a rise in oil temp. Everything with the engine seemed normal during the run up.

Following the run-up I positioned the aircraft with the tail section just off the end of the asphalt runway to allow me the maximize the length of the runway. I then proceeded to hold hold the breaks and accelerate the engine to full takeoff power 35 inches of manifold pressure and 2,250 RPM. After the engine went to full power I released the breaks and began my takeoff roll. The takeoff roll was not noticeably different than any other takeoff with a 360 gallon load. The tail came up at a point down the runway that I have experienced on other takeoffs so nothing seemed out of the ordinary. As my takeoff roll continued I did not feel that the airplane was building speed that this plane normally does. As I reached a point where I normally begin to get airborne I attempted to pull the plane off the ground. After doing so I felt that the airplane would not fly so that is when I began to release some of my load by opening the hopper gate using the dump handle. As some of my load was being dumped I started to become airborne. That is when I closed the dump handle believing I would be able to clear the standing corn without releasing any more of my load. However as I approached the corn field and tried to clear it I felt the airplane settle back toward the ground. That is when I attempted again to release my load. By that time it was too late that is when my main gear and spray booms contacted the corn which proceeded to bring me down.

As I was being drug into the corn my right wing caught which caused the airplane to spin clockwise coming to rest pointed nearly in the opposite direction of takeoff. After gathering my senses I proceeded to turn off the master electrical system and shut off the main fuel control. I then exited the airplane under my own power.
