Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Tail wheel attachment spring broken. Both main landing gear collapsed. Two 18-inch long aircraft structural tubes bent at left main gear attachment point. Small nick and very slight bend in outer 4 inches of propeller tip.

There was no damage to other property.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The purpose of the flight was to allow the private pilot occupying the front seat (flight crewmember 2) to become familiar with the aircraft's handling characteristics throughout the aircraft's normal operating envelope. (Flight crewmember 2 had constructed an Experimental Amateur-Built aircraft of the same make and model and was preparing for the first test flight of his new aircraft.) During the preflight briefing, the pilots discussed the aircraft's control characteristics, emphasizing the very light and highly responsive flight controls.

The aircraft departed KCPS at approximately 1330 CDT for a local aircraft familiarization flight. The flight profile included climb, cruise, descent, shallow turns, slow flight, normal unaccelerated stalls, steep turns, S-turns, and one full-stop landing and takeoff and 3 touch and go landings at a nearby sod runway airport (H49) before returning to KCPS for 3 touch and go landings. All maneuvers were performed satisfactorily.

During the third landing at KCPS at approximately 1450 CDT, flight crewmember 2 applied an excessive nose-up control stick input to initiate the landing flare, resulting in a higher than normal flare with deteriorating airspeed and a rapidly developing sink rate.

Flight crewmember 1 took control of the aircraft and initiated a go-around as the aircraft made a hard touchdown resulting in structural failure of the tailwheel attachment spring and loss of directional control with subsequent departure from the paved surface. As the aircraft entered the grass adjacent to the runway, the left main landing gear failed.

Seeing that the aircraft was traveling toward a concrete drainage ditch between the runway and the parallel taxiway, flight crewmember 1 added power to fly over the drainage ditch before pulling the mixture control to full lean, shutting down the engine, and flying the aircraft to a smooth landing on the grass. The right main landing gear failed as the aircraft slowed to a stop. Flight crewmember 1 turned off the mags and master switches and both pilots exited the aircraft safely with no injuries.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

A better appreciation for the more fragile nature of the landing gear structure of this particular experimental aircraft design would have led to more cautious aircraft handling and a quicker positive action to prevent a hard landing.
