September 5, 2015 N328TV accident report

This report was done the morning of September 6 when I was in clearer state of mind and could remember all date.

Weather: Clear sky, high cirrus, temp @ 75 (approx)

Overall plan was to fly Young Eagles and give a few planes for the third year from a hay field at the annual Port Wing Fall Festival. The field is approximately 2500' long with a slightly rolling terrain. I have flown out of this field for over 30 years with no problems.

These are approximate time CDT

0700 Weather radar check with DUATS. No systems apparent.

0830 Departed Y77. Preflight done. Both fuel tanks full. Main visibly checked with measure stick. Rear tank overflow out of vent when full. This was done at last shutdown. Engine run up done with no anomalies.. Departed Y77 on runway 08 Very slight wind from SE. My imagination or did it take longer to get the tail up and acquire lift off speed?

0840 Landed at BBI (hayfield one mile south of Port Wing). Grass was long and wet from rain the night before. No problem landing and not a safety issue and landing was uneventful. Decided grass needed to be mowed if I was going to give rides. Had a friend mow a 40' wide strip on the smooth part of field. There were a few hay bales at the north end of the field but they would not be in the way as they were very near the tree line at the north end of the field. (I have landed here with the hay bales for over thirty years and was comfortable with flying there.)

0930 Did a landing on the new mowed field. I still had a feeling that it took longer to attain flying speed but it did not seem unreasonable at the time.

1000 Start to give ride to a friend. Asked his weight. 250 #. Mine is 160#. Full fuel minus approx 5 gallons. Not an over weight problem. Started take off down hill. I did not like the way the aircraft was performing and aborted the flight half way down the field and returned to the upper end. I told the fellow to exit and stop back after I had burned off some fuel.

1015 I took off solo again. Did not like the performance on take off. Made a turn and set up for landing. Made sure carb heat was on and fuel boost was on. I did notice the usual 4 to 5 psi on the boost gauge. Turned to final and felt I was a little low and applied power. Throttle went in, engine continued to run, no roughness or dead cylinder, but there was a definite lack of power. Pulled back slightly to avoid hay bale and the end of field and the tail struck the bale. The plane flipped over and came to rest inverted. I was extricated with the help of the two fellows and some helpers who had helped me previously. I exited with minor scrapes and abrasions.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I probably should have listened to my inner thoughts and gone back to the airport with a longer runway. None of the symptoms or feelings ever presented a "red" flag. Being a technician, teacher and business owner in the automotive field I did not see or feel an actual problem. "My bad".
