Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

No property damage at the airstrip. Vertical stabilizer and rudder, passenger side strut bent, engine mounts broken, prop bent, cowl bent, top antennae broken off, top strobe broken off, estimated cost to repair exceeded value of 1947 vintage aircraft.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Coming from the North-North-East having avoided overflying Lebanon I executed a 45 degree entry to a short left base to runway 18 then turning left to a heading of 180 for final approach just North of I65 over the fairgrounds so it was about a one and 1/2 mile final. That final was giving lots of time to survey both runways. No water puddles were visible the turf appeared smooth and even. The windsock was hanging limp indicating last wind direction was out of the South. Announce on Unicom 122.8 Cessna 2614N final 1 8 on the grass. Unicom did not reply which is normal as 614 is not attended. Frankfort KFKR from whence we departed was only 15 miles North and did not have much rain at all that day and it could not be known that Boone County did. Having been based three years in a hangar at 614 Lebanon Boone County Airport I was familiar with common procedures among pilots there which was landing on the grass and departing on the asphalt. A soft field wheel landing was made with full flaps, touching down on the two main gear evenly and very softly to sense the conditions. The touchdown was 1000 feet South of the North most end of the runway, at a point just east of the windsock. The wheel landing is used to test the turf, everything was normal, after a 400 foot roll, no excess drag noted, no indication of water standing, so power was reduced to idle, carb heat was already full on flaps were full down. The tail was coming down normally. At that point a puddle was seen 30 feet ahead, full back pressure on the yoke did nothing to help jump over the puddle so we know the speed was below 40 mph. Before full power could be applied the mains were into 3 inches of water hidden standing just at the grass-line tops. The airplane slowed abruptly. The tail came up higher than normal, quite high, paused momentarily while still moving forward as if the tail was to drop down again, then the mains were still dragging in water at the center of the puddle and the tail came up higher still until it came all the way over the top, still in the direction of travel. The plane came to rest just beyond the puddle, upside down. I shut the Master off, Mags off, and the Fuel off, and retracted the flaps while hanging suspended by the seatbelt and shoulder harness. I released the belts of passenger and then myself. Then I unlocked and opened the passenger's door, assisted passenger out first, and then followed behind him asking him to get clear of the plane. We were both uninjured. Once clear of the plane I verified there was no fuel spills from the engine compartment or from the wings and that there was no danger of fire.

Both of the next two days I inspected the landing area. All the water was absorbed into the ground, no puddles remained, and not even any mud. The area where the plane came to rest was obvious from the fuel stained grass marking the spot where a small quantity of fuel escaped the overflow vent caps from each of the two wing tanks. The grass was discolored. The area was not visibly lower than immediately North and South of where the puddle had formed. In fact a lower spot through which we rolled on the rollout was North of that one but it did not have any standing water in it at the time of the landing.

Signed 8/31/2016

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Do not land on unattended grass strip after frontal passage even 8 hours earlier where grass may still be wetter than expected in spots not visible from the air.
