Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft was damaged by CAPS deployment and ground impact. Additionally, engine damage occurred causing loss of oil.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

After a normal preflight, we departed Bentonville AR (KVBV) at approx 934 am (central) in VMC conditions on an IFR flight plan to Waco, TX (KACT). Passengers included Maurice (Trey) Willis sitting in the right seat and Cliff Slinkard in the right rear seat.

After takeoff, we experienced a normal climb and were cleared direct to CQY (waypoint) and to a 10,000 ft cruising altitude where we were in VFR on top conditions. At approx 944, as we reached our cruising altitude, the CAS system flashed caution (yellow) for oil pressure. I initiated an immediate turn towards the nearest airport. (KFYV was 10 miles to our E/NE but was obscured by clouds) and notified ATC of a low oil pressure issue. The engine was still generating power and oil pressure CAS was still yellow. ATC cleared us at pilot's discretion to 4000 ft. ATC provided HDG 010 for vectors to a short final for RWY 16. The field was not in sight. In the descent, oil pressure continued to drop and CAS alert now showed warning (red) status and indicator showed oil pressure at less than 10 psi. Engine still was generating power but was becoming inconsistent. At approx 948, ATC recommended HDG 160 and 3300 ft for minimum vectoring altitude. (MVA) The field was still obscured by clouds. Power was now substantially impaired and we were unable to maintain 3300. Altitude quickly fell to 2200 ft, below minimum vectoring altitude. Despite full power setting, engine would not respond. ATC reported the field at 12 o'clock, 3 miles but was still obscured by clouds. I attempted to bleed off remaining airspeed to regain altitude but was unable to climb more than 100 feet. At approx 949, at 2300 ft MSL, approaching CAPS minimum altitude, with the engine not responding, the aircraft stall warning alerted me that there was no longer any airspeed to trade for altitude. I notified the passengers and deployed CAPS.

After the canopy opened, the fuel mixture and magnitos were secured. We then braced for impact. On, or shortly after impact, the front airbags deployed. After assessing the condition of the passengers, we all departed the aircraft through the doors without assistance.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
