

NATIONAL TRANSPORTATION SAFETY BOARD PILOT/OPERATOR AIRCRAFT ACCIDENT/INCIDENT REPORT

This form to be used for reporting civil and public aircraft accidents and incidents

BASIC INFORMATION

Accident/Incident Location

Nearest City/Place: Ingleside (McCampbell Airport) State: TX

ZIP: 78362 Country: USA

Latitude: N27.54.47 Longitude: W097.12.41

(Enter in decimal degrees or degrees:minutes:seconds)

Accident/Incident Date/Time

Date: 10/25/2106 Local Time: 1415
mm/dd/yyyy

Time Zone: Central

Collision with Other Aircraft: ☐ Midair ☐ On-ground ☒ None

AIRCRAFT INFORMATION

Registration Number: N48182

Manufacturer: Boeing

Model: Stearman N2S

Serial Number: _____

Year of Manufacture: 1940

Amateur-Built: ☐ Yes ☒ No If Yes: ☐ Kit/Plans ☐ Original Design Make: _____

- ☐ IFR-Equipped and Certified
☐ Commercial Space Flight
☐ Unmanned Aircraft

Maximum Gross Weight: 2635 lbs

Weight at Time of Accident/Incident: 2200 lbs

Number of Seats: 2 Flight Crew Seats: 2

Cabin Crew Seats: 0 Passenger Seats: 0

Number of Engines: 1

Category of Aircraft

- ☒ Airplane
☐ Balloon
☐ Blimp/Dirigible
☐ Glider
☐ Gyroplane
☐ Helicopter
☐ Powered Lift
☐ Rocket
☐ Ultralight
☐ Unknown

Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Damage to upper wing. Damage to lower wing tips. Damage to horizontal and vertical stabilizer. Engine damage suspected due to rapid stop when prop struck ground.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

This was the second sortie of the day. I added 15 gallons of fuel and 1/2 gallon of oil prior to the second flight. The sortie left KRAS at approximately 1320 after an uneventful practice pattern and departed VFR to KRKP via north along the beach, St Jose Island, following the ferry road to Aransas Pass and then up to Rockport. Winds on AWOS favored runway 18 so I entered a downwind for that runway. I elected to do a low approach vice a landing for two reasons: windsock indicated winds more aligned with runway 14 and a Navy aircraft was in the pattern for 14 and I did not want to be a crossing conflict. I did a low approach to runway 18, joined a downwind behind the Navy aircraft for runway 14 and conducted an uneventful stop and go. I elected to depart KRKP VFR for KTFP so as not to be a hindrance to the Navy trainer.

KTFP: Runway 13. Winds were variable at about 5-7 knots aligned with the runway to slightly left of centerline. I flew two uneventful stop and go approaches and landings.

On the third takeoff, I was aligned with runway centerline for the engine advance and initial roll. At the light weight, the plane accelerated almost immediately to 45 MPH at which point I pressed the stick forward to raise the tail. I noticed the plane start to pull toward the right side of the runway and I released some of the right rudder I had in for takeoff. I felt the plane was light on its feet and I glanced at the airspeed and saw 65 MPH. I nudged the stick back and the plane instantly became airborne. Immediately I felt the nose of the aircraft yaw to the right as though it were weather vaning into the wind. This was odd because the wind had not been from the right side. Although odd, I was not concerned with the yaw initially because I was airborne, so I released some back pressure to allow the aircraft to accelerate. The yaw to the right progressed and the plane start to roll to the right with a slight pitch up. I applied increased left aileron with coordinated left rudder and released back pressure. Once I saw the roll was not controllable with the moderate inputs, I applied full aileron and rudder opposite the rolling motion. The plane continued to roll to the right striking the ground with the upper wing at approximately 90 degrees' bank, then rolling to the nose (engine) and then flipped over the nose to the inverted position.

The aircraft came to rest approximately 30 yards to the right of the runway in the grass. The entire event was only seconds in duration.

Terrain at the scene was flat with approximately knee high grass.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I believe the Stearman is a safe aircraft, but as always there is a risk in aviation, especially with regard to older aircraft. I believe the CAF does their best to run a safe operation. No specific recommendations other than continued vigilance on maintenance and preflight of these old aircraft should continue to be emphasized.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Failure of the right horizontal stabilizer caused uncontrollable rolling motion to the right.

Fuel on Board at Last Takeoff

(Convert from pounds, as necessary)

Approximately 18 gallons Gallons

Fuel Type

☐ 80/87☐ 115/145☐ Jet B☐ Other, specify _____☒ 100 Low Lead☐ Jet A☐ JP8☐ 100/130☐ Jet A-1☐ Automotive

Other Services, if Any, Prior to Departure

I had approximately 1/2 tank (23 gallons) of fuel at KRAS after first sortie. I added an additional 15 gallons of 100LL and 1/2 gallon of oil to the engine prior to second sortie.

EVACUATION OF AIRCRAFTWas an emergency evacuation of the aircraft performed? ☒ Yes ☐ No

Method of Exit – Describe how the occupants exited and how many occupants evacuated each location

Once hanging inverted in the straps, I turned off the ignition, radio master, and master power. I released my seatbelt/shoulder harness and dropped to the ground and egressed away from the aircraft. I walked over to the FBO and reported the incident to Justin. Justin and Lonnie went out to the aircraft with me and one of them went under the aircraft and turned off the fuel.

ADDITIONAL INFORMATION (Please type or print in ink)

Use this space if additional space is needed for any answers.

As I have thought this incident through, I have continually focused on the vertical stabilizer because the flight 'felt' similar to a hard over rudder that American Airlines had us simulate in response to a 737 hard over rudder incident. I know the Stearman does not have a powered rudder, therefore a hard over is not possible, but because of the feel of the flight I have thought a broken rudder may have been the cause.

As I reflect, I remembered the outer half of the right horizontal stabilizer was bent down immediately after the incident. Once the aircraft was rotated back onto the landing gear, I remember seeing some guys flip that outer portion of the horizontal up easily to approximately the 80% up position (not quite vertical). When they released it flopped back to the down position. Before the towing, they flipped it up again so it would not drag, but again it did not stay in that up position. They then pushed the outer piece all the way over and laid the outer portion of the horizontal stabilizer on the inner portion. You definitely heard some minor cracking as they did so, but the push took very little effort.

It occurred to me that the broken outer portion of the horizontal stabilizer when displaced in flight would create significant drag and rolling tendencies that could be uncontrollable at slow speeds very similar to a rudder failure.
