Date Report Received

10/18/2017

Concerning the engine stoppage on my flight, at first I thought the most likely cause for my engine to stop was spark plug fouling or fuel line blockage. We haven't yet been able to inspect the plane so we don't really know. A day after the forced landing I began to think maybe ice was a factor. So I looked up the weather data for Cheyenne at the time of my flight. When I plotted the data on an icing chart it sure looks like there was a high risk of icing.

If it is found to be icing, then the following may be pertinent.

I am starting to understand some things I had not understood before. I think I always equated carb icing with wing/airframe icing. I knew that wing icing only occurred in visible precipitation. I guess I assumed carb ice was the same. I understood how carb ice worked, and that is was a different than wing ice but thought it occurred in the same conditions. My failure was to not make the distinction. I thought flying only on clear, calm days was insurance against any kind of icing issues.

The whole time I was thinking 'fouled plugs', 'fuel line blockage', it could easily have been carb ice. I thought that I would never be in conditions that would cause carb ice, so I never considered it. It was completely off the table. Although the carb heat system on my plane was pretty minimal, it might have helped, especially if I had got it on early.

So, I had an incorrect mind set about ice all along. I thought that as long as I only flew on good days there was no problem. Carb heat was just for IFR. It could have been a fatal mistake.

I got a DUATS briefing that morning, but only looked at the TAFs and TFRs...
