Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft sustained substantial damage. Nose gear was bent aft into the lower cowling. Aircraft was inverted, tail was damaged, and fuselage aft of the rear window was twisted. Approximately 250 Square feet of Soybeans were damaged in the field.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Flight instructor and student were planning to complete a BFR per 61.56 in a C150. The decision was made to make the flight portion first due to winds that were forecast to increase. Following a pre-flight, the aircraft was started, and taxied to the Sod runway at KBDT 03/21. We back taxied down runway 21 noting that it was a little soft, but looked ok. A run-up was completed at 1500 rpm, with magnetoes and carb heat functioning normally. We began the take-off roll, and I noted that we were accelerating slowly. I felt the nose "dive" a couple of times, an indication that the student was light on back pressure for the soft field takeoff. I advised him to get the nose up and get it into ground effect as the runway was soft. As we broke ground, the aircraft seemed to just hang there. I took the controls from my student, and attempted to lower the nose to accelerate, as the engine did not seem to be making full power. At this point we were out of usable runway, and the airplane would not accelerate. My student said, "it will not turn more than 1900 RPM." I attempted a slight right turn to align completely with the wind, and noted the aircraft buffeting, as it was very slow and close to an aerodynamic stall. I determined we would not be able to safely climb and return to the airport, so I aimed for the soybean field in front of us. As I attempted a flare, the aircraft touched down on all three wheels due to the slow speed at which we were flying. The nose wheel collapsed aft, and the aircraft rolled onto its back. My student and I were able to unbuckle our belts and climb out of the aircraft by opening the doors. In looking around the wreckage, I noticed I was bleeding, and called my business partner for a ride to the hospital for stitches. The FAA and NTSB were notified.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The best prevention of this accident would have been an aborted take-off upon realization the aircraft was accelerating abnormally slow.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No
