Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

No noticeable damage to rural property. Damage to airplane, Prop damaged, motor mount damaged, prop spinner crushed, Upper and lower cowl damaged, windshield cracked, windshield supports bent, radiator crushed, firewall bent, muffler appears bent, nosewheel broken off, nosewheel fairing above strut torn, nosewheel fairing broken, 3 foot long vertical crack on left side of fuselage aft of firewall, steel support for wing spar at top of cockpit bent, control rod for speed brake damaged, many leading edge of wings scratches, left wing alignment pin slightly bent, outboard 2 ft of left wing tip ripped off, outboard 2 ft of left flaperon broken off, inboard root of left flaperon crushed, left air brake stuck in extended position, both main wheel fairings broken, Skeg missing from bottom of fuselage below Vertical stab includes tail tie-down, rudder attach point damaged, trailing edge of right wing tip separated,

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

I planned to make a circle of Antwerp then return home. I had 5 to 6 gallons of fuel in each main tank, in the right was 1 to 2 gallons of LL100 plus 5 gallons of high test auto fuel in that tank and I was using the right tank. The left tank had app 5 gallons of LL100 as indicated by the fuel tubes. I flew to Antwerp circling from the east side counterclockwise staying to the right of the river looking at the ice buildup and at the south side of town about 1 mile south. I was running about 1.7 gph, the fuel flow indicator had not been calibrated yet, this is around 4500 rpm and about 17 in HG. This is a good ground viewing speed, I noticed that the oil temperature was about 173 degrees F. It has a thermostat so that indicated that the oil was bypassing the radiator completely so I increased Manifold pressure and the engine began to run rough. I noticed that the fuel pressure was now low so I turned on the auxiliary boost pump, switched fuel tanks but the roughness got worse so I switched back and for a few seconds it seemed better. At this point I felt that an emergency landing might be necessary and since I was over US 24 which is 4 lanes and might appear appealing, but this was not acceptable as the semi trucks were about 5 to 10 truck lengths apart, moving at about 70 mph and I did not want to cause a airplane/truck accident, with a 35 foot wing span, I would have to get at least 18 feet off the road very quickly if I could squeeze in.

This was unacceptable so I thought I might be able to reach a private airstrip about 2.5 miles ahead along the north side of 24 just north of the railroad, but the wind aloft was from the east and it was apparent that I would not make it. The engine was now running worse producing almost no power and township road 51 looked as the best place to land off airport. As i got closer it became clear that the portion south (which is stone road with ruts) of Township road 180 was seriously covered with ice and snow, and I thought that the portion north of T180 might have been plowed and might offer more adequate braking. The available space looked like about the same as my runway (1300) which I can land in 1/2 the distance easily.

The wind at the surface was app 080/05 the road was from the electric poles to the railroad track was 1205 feet and the distance from the RR X ahead sign was 772 feet and I have easily stopped in 600 feet. I touched down off to the west side of the road to clear the RR ahead sign. But the road was icy and very slick and it became apparent that I would not be able to stop before the railroad crossing and I was concerned about fitting between the RR Crossing signs which were built on 4x4 wood posts about 8 foot high and 28 feet measured from left to right side (it would not work as the wing span is 35'). I was still going about 30 mph as I approached the RR crossing and there was a large bush on the left side of the road about 12 feet and 10 to 13 feet high before the railroad and the wing hooked the bush and tore off the outboard 2 feet of the left wing and spun the aircraft to the left. So the aircraft crossed the track turned 80 degrees to the left and did not hit either RR crossing posts.

After crossing the track the airplane entered a small ditch (1 & 1/2 feet deep) on the west side of road where the nosewheel broke off then the airplane dug in and stood up on it nose for about 2 seconds while spinning slowly counterclockwise viewed from the inside, then fell with the tail pointing north in the direction of travel.

After the accident I lamented to a farmer that maybe I should have landed on a farmers field but he drove in the disked field the smoothest option and said it was very rough. So with my small wheels I would have torn all the wheels off the airplane most likely doing more damage. These fields have frozen solid freezing after a rain and making a rock like surface. A plowed field would be worse as these would be 6 inch to 12 inch frozen clumps of dirt.

I have often told my students that someday you might have a forced landing with no good solutions. At this point you must keep 3 rules in mind. 1. do not harm anybody on the ground. 2. do not harm anybody in the airplane (the pilot is someone too) 3. try to not damage the airplane either. This is also in priority order.

RECOMMENDATION (How could this accident/incident have been prevented?)**Operator/Owner Safety Recommendation**

With the sun behind me in the late afternoon the fuel meniscus was very hard to see quickly under pressure so as far as being able to see fuel quantity was very difficult. So under time pressure I went from the preflight amount.

In the past I flew an airplane that had fuel visual tubes to indicate the amount of fuel remaining and it had some kind of ball (maybe hollow glass) which was a dark color and was very easy to read the fuel quantity. This would be a big help when you want to see fuel quantity in a hurry. On the ground under certain lighting conditions it is almost impossible to tell the amount of fuel remaining. I must use a flashlight lighting the tube from an oblique angle.

Previously the concern about this engine is getting too hot on the ground and at slow flight speeds and maybe there is a problem in getting the engine too cool the only temperature limitation for takeoff is to have an oil temperature of over 120 degrees F. This engine does have additional air scoops that the previous Virus SW airplane did not have.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)

Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

engine lost power from low power setting during low temperature operation
there is a service bulletin for vapor return line but so far no one can tell me if the bulletin has been complied with
IM-73-00-00 It appears that SN 877 has a vapor return line which may satisfy this bulletin.
