Description of Damage to Aircraft and Other Property (Use additional sheet if necessary)

Right wing tip tank Damage to lower fairings and landing light housing. Right outboard Flap, ~~and~~ aileron, elevator sustained light to moderate scraping of lower skin. Elevator tip cover ground down. an Area on the lower rightwing outboard sustained Damage to the skin which will require a flush Patch to repair. inboard Right Gear Door.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

Aircraft Departed KPTN at app. 2:30 PM on 03-22-18 a IFR Flight Plan for a two Day business trip. Flight was uneventful During takeoff, cruise and descent into KMKE with weather basic VMC during Departure, cruise and Descent into KMKE. Approach and landing were normal and all aircraft systems performing normally. Landing and initial Roll out were also normal with Thrust green gear lights and Full Flaps deployed. At approximately 1500 ft after touch down moderate braking was applied and a planned turnoff to the right on taxiway Echo was planned at which point the right wing began a slow but deliberate fall until the right wing tip tank contacted the runway (19) at which point the aircraft began a right turn due to the drag of the tip tank. The collapse of the right main gear appeared to have collapsed at app. 35 knots until it came to a full stop Rotation 90° to runway heading and the aircraft half on taxiway Echo. and half in the grass next to taxiway. No smoke, fire or any other abnormal smells were encountered at which point I secured the aircraft and we exited aircraft thru the cabin Door. No injuries sustained.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I don't feel that this could have been completely avoided if the cause of the right gear collapsing was due to the adjustment screw on the downlock link failing. At some point during the rollout this adjustment screw failed at which time ~~the~~ relieved the necessary pressure to keep the brace assb. over center therefore allowing the gear to collapse (retract). - See attached picture when the adjustment screw failed it allowed itself to hang free in the gear well where at some point during the collapse it jammed on something which caused it to break one of the ears where it was attached to the trunion. Did the screw fail from cycles, age or possibly misadjust of the gear rigging over 40 plus years - maybe a combination of all these factors. I am very interested to see what you find out!!
