NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I had just finished conducting a Directors Meeting at Citizens State Bank and Trust Company in Roxbury KS, and was intending to fly to Mcpherson (KMPR) for fuel before continuing on Wabaunsee County KS. I have a farm in Wabaunsee County and was stopping there (unimproved pasture strip) to see if it was too dry to burn pastures before I move a cattle herd out there for the grass season. I was taking off from Smoky Valley Road (a county road in McPherson County, Kansas) at approximately 1400 hrs on April 24, 2018. As the tail wheel left the asphalt, propeller torque caused the aircraft to slightly shift direction of takeoff a few degrees to the left. I was slow to respond with rudder input, and the response was also inadequate. The aircraft moved the centerline left a few feet and my left wingtip hit a highway sign as the aircraft was leaving the ground. The left wing impact caused the aircraft to turn an additional 20 to 40 degrees left and decreased left wing lift while not affecting right wing markedly. The left and right wing lift imbalance then caused the aircraft to nearly "stand on" the left wing. I worked to level the wings with hard right aileron and rudder inputs and was able to generally regain control. The aircraft was still full power, with full flaps and climbing rapidly (1800-2000 fpm). I could tell that there was significant left wing and left wing control surface damage because it was clearly visible from the cockpit and the aircraft was extremely difficult to keep the wings level. At that point I would have preferred to begin reducing power, but the direction the aircraft was now heading was directly at a cell tower with guy wires. Due to the aircraft structural problems I was aware of, but could not fully evaluate, I did not want to make the steep turn either left or right. I was concerned the compromised left wing might become detached from the fuselage. So I kept the wings level and continued the climb over the tower, and once clear, fully reduced power. At this point I estimate that I was 150 to 250 feet AGL and could see a tree line at the end of the field I was flying over. I attempted to execute a very short landing with the goal of stopping short of the tree line. I do not recall the last few seconds of the flight, but believe I was probably still approximately 1-3 off the ground when I hit the trees at about 40 knots. I quickly became aware of leaking fuel immediately after the crash and was able to unbuckle my harness, exit the plane, and had walked 30-50 feet toward Roxbury when a local farmer pulled up in a truck and offered me a ride the less than one mile back to town.

The bottom line is that I have determined that using roads for take off and landing is outside the boundaries of my new acceptable risk profile. I have 15 very small retail bank branches spread out over 15 small communities, 12 rural counties, and 2 states that I am able to provide leadership and oversee their operations effectively only by flying. My first accident involved a Piper TriPacer landing off airport. I determined I needed more training and a more appropriate aircraft. After quite a bit of research I settled on a tailwheel Maule with large bush tires. I also spent a week in Montana with a Maule "off airport" flying orientated CFI, getting additional training. My second accident involved that Maule, landing on the same road as this third accident. The accident that time was caused by my inexperience understanding how a brisk crosswind is affected by an elevated landing surface (upwind wing increased lift, downwind wing decreased lift). More horsepower would have helped me regain control. So I spent another week in Montana receiving additional training, and got another, but higher horsepower Maule. I can take off and land on a road 99 times out of a 100 with no problems. Unfortunately, in aviation 99% is not good enough. I am currently developing a plan involving prepositioning 4 wheeled vehicles at 4 different small airports that lack courtesy cars. It is imperative that I continue to fly, otherwise at least 6 of those bank branches will have to be closed and those 6 communities will not have access to a financial institution. These are towns of less than 350 people.

Finally, a few practice take offs and landings at an airstrip would have been very beneficial given the 100 day interval between last flight.

I HEREBY CERTIFY THAT THE ABOVE INFORMATION IS COMPLETE AND ACCURATE TO THE BEST OF MY KNOWLEDGE
