

On 6/7/18 approx 19:45 hrs:

Had been flying & doing T&Gs. Had performed 4 T&Gs. I took off on last T&G, Runy 18, on crosswind checked weather & remember it being Winds 100' @ 3. Went through usual Traffic pattern & set up to land. Landed as usual, soft touch down, suddenly the plane ~~over~~ turned immediately left, almost 90° to the runway, I placed immediate right rudder pressure & pulled the throttle (as usual it was pulled) to Idle. Plane was obviously going off of the paved surface. I applied back pressure on the Yoke to raise nose wheel such that it did not dig into the soil. Plane rolled to a stop in the grass. I was able to taxi the plane back to the runway & subsequently to the ramp.
