Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Propeller strike, engine under power, aircraft nosed-over, rudder damage upon nose-over to inverted position.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

- Approximately 10:30 AM MST departed KELP on Runway 26L after receiving ATIS and clearance to fly at 5,500' over downtown El Paso towards KDNA and then eventually NM05.
- Entered 26L at Uniform with winds at approximately 8-10 MPH from 220 degrees.
- Proceeded over downtown El Paso and leveled at 5,500'. Shortly afterwards, Radar service was terminated and I entered the VFR frequency 1200.
- Obtained ASOS (124.175 MHZ) from KDNA to verify that winds favored runway 28. I seem to remember that the winds were 220 degrees at 8 MPH with no gusts reported, but can't be certain.
- Entered right-pattern traffic downwind to Runway 28 at KDNA, midfield, with 3 aircraft either in the pattern or calling to enter. Two were entering from the northwest.
- Abeam of the "numbers" I reduced engine power to 1400 RPM and trimmed to 70 MPH with an approximately 400 FPM descent..
- Performed one touch-and-go on runway 28 with a slight crosswind breeze, but the windsock seemed to be dancing from a quartering headwind to a direct crosswind.
- As I was on the rudder pedals upon landing I remember feeling an unusual mechanical sensation just prior to rotation.
- After rotation, I remained in the traffic pattern for Runway 28 and turned crosswind to downwind when another aircraft called to state that they would be #2 on a right-downwind for 28.
- At the numbers, I reduced engine RPM to 1400 RPM and trimmed for 70 MPH and a 400 FPM descent. Upon turning from base to final for Runway 28, I remember seeing two-white and two red lights on the PAPI, but also noticed the windsock indicating erratic wind directions, however still indicating a head to cross wind.
- On short-final, I had crosswind corrections in place and, over the numbers, further reduced power and prepared to land the aircraft.
- I then felt the aircraft begin to aggressively weathercock to the left (crosswind gust), so I corrected and applied aileron inputs to help correct. It appeared too late to perform a safe go-around and I elected to continue the landing.
- The tailwheel contacted first and then the main gear and I pulled the throttle back completely, but the rudder inputs were unreliable and, felt like, partially responsive and then the aircraft proceeded to veer off the runway towards the left (west) more rapidly.
- I applied full rudder, and heel-brakes to prevent a ground-loop, however the aircraft continued to veer left and then exited Runway 28.
- When the mains contacted the dirt, the tail rose significantly and then the propeller made contact with the ground.
- Within 50' (estimate) the aircraft stopped and the tail proceeded to rise until I was in a perpendicular position to the earth. It stayed in that position for about a second (my account and that of a witness across the runway) and then the wind blew it over into an inverted position. The ELT was activated sometime in this sequence and both frequencies (122.5 and 406 MHZ) transmissions were transmitted.
- At this point I exited the aircraft and was greeted by witnesses / responders within minutes.
- I sustained no significant injuries nor was there any damage to anything on the airfield.

Note: After collecting the flight bag and headsets out of the aircraft, I performed a visual inspection around the inverted aircraft. I then noticed that the left rudder spring was disconnected from the tailwheel control-arm and that the safety-wire was missing. The right spring was safety-wired and connected properly.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Tailwheel connection should not have disconnected.

This contributed to the LOC upon landing.
