Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The only visible damage to the plane was the left elevator (slightly bent from the weight of the plane) and the left wing tip. The right gear and nose gear remain extended. The engine was shut off prior to landing and the front gear and right main gear were down.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The left main landing gear on my Cessna 182 RG did not engage after I was doing some routine pattern work at the Beloit airport, K61. The green gear light did not turn on so I did a visual check using the side mirrors and noticed that the left main did not descend. After several attempts of retracting and then engaging the landing gear, the left gear still did not engage. I tried using the hand pump but was not able to pull it out - it was completely stuck in place. Circling the airport, I chose to do a power-off landing on a grass strip - runway 22. I tried to keep the nose up as long as possible until the plane turned to the left 180 degrees and came to a stop. There were no other passengers aboard, no injuries at all and no other planes in the pattern.

Two weeks prior to this incident the plane had an annual inspection performed where the landing gear was tested. Three landings had been made since the annual with no apparent issues in deploying the landing gear. A preliminary test flight was made at the K61 airport and another flight to Wichita (KICT) was made for an IFR 24 month flight check at Bevan-Rabell. The return flight to K61 was the last landing made. On Monday, June 18, I went to perform some maneuvers and do some pattern work before my flight back to Austin when the gear would not fully deploy.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The left main gear did not extend due to a loose screw from the brake caliper that was not properly secured after an annual inspection. The front and right main gear did extend and were functioning properly. This was discovered after freeing the stuck gear. The gear mechanism was working properly for three landings but finally was blocked on the fourth attempt. This was simply a servicing error (not tightening the left brake caliper bolts) which had been removed to grease the wheel bearing on the main wheels.

The FAA inspector, Bobby Warren from Wichita, determined that one of the bolts from the left brake caliper had not been tightened properly after the annual inspection one week prior. This bolt had loosened enough to become wedged in the wheel well preventing the left gear from deploying. This also made it impossible to release the hand pump which would have been futile since the gear was jammed stuck. A safety wire would have secured the brake caliper bolts from loosening as well as applying a torque wrench in securing the bolts. These brake caliper bolts have a wire hole in them but apparently there are no AD directives that they must be used. A thorough visual inspection of all landing gear components should be added the pre-flight check list.
