July 25, 2018

Friday July 20, 2018 ~ I woke up my usual time of 7am. Prepared certain medical things for my husband for when he once wakes up, drank 2 cups of coffee then finished dressing. Remember choosing to wear tennis shoes for that is my preferred footwear when flying my helicopter and I had scheduled with 3 people a local flight that morning.

8 am, had a meeting with our employees. During the meeting I asked one of them to pull the helicopter (by a helipad) out of the hangar (which is on our private property).

9 am, I was at the helicopter starting the exterior pre-flight requirements, which went well and was fully checked out. Next I arranged the 3 passengers seating for weight & balance. Interior Checklist went well as usual, all within limits and fuel gage showing approximately 27 gallons. Start up was smooth with N1 (cool start). I checked Atis once the radio and navigation was switched on, winds 270 @ 7 mph. All passengers had headsets, therefore verbally checked that their seat belts secured and announced lift off.

ETD 9:45 am towards the West, at approximately 50 ft. the left front passenger door opened, therefore I made a right circle back to wards our hay field and landed to secure the door. I then continued inflight towards the South. Continued local flying for approximately 30 to 45 minutes at which time I landed at DWH airport for refueling. Gill Aviation is sending the receipt by email, so estimate 54 gallons of Jet A.

ETD 10:55 am from DWH towards the North with Atis/tower reporting the same as earlier. With lift off I was cautious of the new fuel weight, therefore noted lift up at 65% torque with a maximum of 80% prior to transitional lift.

Our continued flight was towards Lake Conroe and local areas.

Prior to returning to home base, I choose to set down in an extra large grassy & flat field to enable a switch of passengers from back left seat to front left seat. Once touch down I throttled down to Flt Idle. Repositioning passenger duration approximately a minute. Once they were situated & seat belts secured, I spooled up to 100% and started raising collective and positioning for a West departure from the field. Approximately 10 ft off the ground the helicopter pulled sharply to the right and went into a spin. From that moment on I do not remember much other than recognizing the left tail rotor pedal was not responding, the torque gage was high (don't remember the actual number) and keeping my passengers calm while trying to regain control before hitting the ground. All happened so extremely fast that my mind cannot recall any details. Do remember only from instinct that just before touch down rolling off the power and flipping the fuel switch off.

Crash time approximately 12:15 pm

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

If the left Tail-rotor pedal would have been effective in correcting the clock wise spin.
