Events of January 19, 2019

Friday morning I arrives at KOCQ at around 10:00 AM. Started to preheat the airplane engine. Started the preflight inspection of the plane.

1. Checked the oil level, oil level was good.
2. Checked fuel in tanks. Left tank Full 30 gallons, Right tank was slightly more than $\frac{1}{2}$, 15 gallons Total fuel on board was about 45 gallons.
3. Checked all controls and plane exterior.
4. Using my pad with ifly GPS
 - A. alt 4,000
 - B. fuel burn 12.5, 2300 rpm, 23 inches, 65% power
 - C. estimated flight time 58 min
 - D. fuel used about 13 Gal

Taxi to run-up area, preform STD run-up. Departed KOCQ at about 11:30 AM. Climb to 4,000' lvi off set plane to 2300 rpm and 23 inch of pressure, 65 % Set timer for 30 min to remind of changing of fuel tanks. 35 min later changes form left tank to right tank. Air speed was about 148, ground speed was about 160-165mph. Arrived at KBUU after about 55 min of flight time.

Departed from KBUU. Preflight inspection of plane, Oil lvi was good, fuel tank left side was about 22 gallons, little more then $\frac{2}{3}$ full, right tank about $\frac{1}{3}$, 8-10 gallons of fuel. Again standard run up. Set fuel to the fullest tank, LEFT tank. Departed about 14:30 from KBUU. Weather was more cloudy, OVC at 5,000 ft , Vis 10, temp -7 , Dew Pt -14. BP was lower 30. Climb to 4,000 ft. shortly after I encountered a some light snow conditions, I lowered to 3,000 – 2,800 feet.

After 25 min of flight I noticed the carb temp to be in the yellow range. It had been before so I continued to monitor this. Looked at my Pad to contact MKE tower to request Flight following, when I checked the carb temp I noticed it was into the red indication of freezing condition. As I reached for the carb heat the engine started to loose RPMs rapidly. Pulled carb heat to full position. Set to a full fuel mix. Turned on electric fuel pump. No change. Gauges indicated there was fuel pressure, then checked magnetos with standard decrease. Switched tank to right side, no change, pushed in carb heat to check engine ran smoother but no power increase, pulled carb heat out again, again engine still ran but very poorly. By this time I noted I was below 2,000 ft. trimmed for best rate " 100 mph" Engine was still not responding to heat. Tried to get results I switched tank back to right. Pulled carb heat in and out again with same result and no gain in power. By this time I was below 1200 , decent rate was about 700 feet per min. I made the distress call stating I lost power and was making an emergence landing. Said a prayer and I chose a field and configured the plane for landing. Full flaps, gear down, speed at about 80 mph. As I lowered I noticed the field had some rolling hills. Knowing that the nose gear would not take much abuse I decided to raise the gear and try to land the aircraft flat. Time was limited and I was not sure the gear would make it up. I still felt it was a better choice. Things went well until the third hill where the

plane was launched by the second hill, floated and the nose came down to hit the dirt. This is when most of the damage occurred.

This is my best account of the events of January 18 when I performed an emergency landing.

^B"

WAS THIS A MECHANICAL FAILURE?

I am not sure why the carb heat did not fix the problem. I flew my 160 piper Cherokee to Maine in December. I encountered carb ice and had similar results. However after only 20-40 seconds of carb heat the engine was increasing in power. I can't say why the Commanche was different. I don't think there was any mechanical failure. I still continue to read to see what the cause was.
