Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Landed in water approximately 29 0.465N 82 50.697N or further west. After departing aircraft was able to shut door and hold onto horizontal stabilizer for about 15 minutes while trying to attract attention of boaters. No damage to horizontal stabilizer was observed at this time. I left aircraft when it began to slide underwater. Aircraft leveled with approximately 1 foot of the tail above the water and began to move east faster than I could swim. Followed behind aircraft for approximately 3 hours when I could no longer see it.

Aircraft was found next day at above location with right wing buried in the mud and left wing out of the water, I have been told.

Aircraft was towed to shore Monday by Sea Tow and beached at the end of Highway 40, Yankeetown, FL.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I am building a Velocity aircraft, experimental, at Sebastian, FL, X26. At 1300 L, 5/17/2019 I loaded N4861P and preflighted the aircraft checking fuel for water in the wings and dip tube for quantity, 68 gallons, which I figured was 1.5 hours left tank and 2.5 hours right tank. Departed on the right tank at 1330 after normal runup, mags checked approximately 50 rpm drop each, prop exercised, good vacuum and instruments set, 10 degrees flaps for takeoff. Takeoff was normal, retract gear, retract flaps, reduce power to 21 in and 2400 rpm and set mixture based on turbo inlet temperature of 1300 cruising at 2500 ft.

Taking advantage of the good weather I flew SW around the restricted area west of Sebastian to observe the area and check out the airports west of the restricted area. At 1 hour I switched from the right tank to the left with a smooth transfer. I continued between the Tampa and Orlando areas and set up navigation to waypoint HEVVN to avoid the ADIZ before turning to 54J, De Funiak Springs, FL, for a refueling stop.

I had just passed over the cooling water outlet of the Duke Power nuclear power plant when my GTN 750, GTX 327 ES and G5 PFD all said main power was removed. The G5 has backup power and switched to the battery. I cycled the master/alternator switch and checked all circuit breakers. I could discover no cause for the failure nor correct it so decided to return to Crystal River, FL, CGC. Making a right hand turn back I began my prelanding check (GUMPS) to have it completed before making what I believed would be a no-communication entry to Crystal River. Gas, I changed from the left to the right tank as it had more fuel. Undercarriage, I put the gear handle down with no result, no indication of the amber or green light, and no sound of the electric pump so I hand pumped the gear down. Mixture enriched. Prop set for max rpm. Tried master/alternator switches again with no change. Engine was producing power. All of this occurring about 1:46 after takeoff according to my Garmin watch.

As I was scanning for Crystal River traffic the engine suddenly quit producing power, propeller wind milling. Best I can describe it was like testing the magneto grounding before shutting down the engine with the mixture. Scanning instruments became a secondary concern as I looked for a way to get to land, but I am reasonably certain I had slowed to normal approach speed of about 80 KIAS developing about 800 fpm decent, but I cannot say I ever consciously looked at the instruments. It did not occur to me to try to go back to the left tank or try the starter. About 25 feet above the water I switched the master/alternator switch off, undid my seatbelt and opened the door to facilitate exiting the aircraft, then flared to minimize forward speed into the water. Upon touchdown the aircraft pitched forward and water began coming in through the door. I rolled to my left to exit the airplane and with the help of the inflowing water closed the door behind me. While holding the trailing edge of the wing I found a small amount of blood coming off my nose which I later ascertained was an abrasion on the bridge of my nose, probably from my prescription glasses forced down on my nose. As the wing settled into the water I moved back to the horizontal stabilizer where I spotted some boaters and tried to get their attention.

After about 15 minutes the airplane began a slide forward and down, to avoid going with it I swam about 20-30 feet away. I then watched the aircraft level out with about 1 foot of the tail above water and pulling away from me and the afternoon sun faster than I could swim. I then drifted/swam in the same direction as the aircraft until shortly before the sun set when I lost sight of it. I then used the power plant and the rising moon to swim to the barrier islands west of the power plant, reaching shore about 0300 Saturday, May 18.

In completing this form I have talked to the Coast Guard if the ELT on 121.5 helped them locate the aircraft. The ELT played no part in them locating the aircraft and there was no report of a 121.5 signal being heard. Local boaters were the first to find the aircraft where it had drifted.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

In preparation to make a no communication entry to Crystal River, CGC, I switched tanks from left to right, the tank with more fuel. At the time of engine failure I could have tried going back to the left tank, but my concentration was on surviving a water landing, where I was, and where I could go. There was no indication of fuel starvation.

Generally I would choose a higher cruise altitude over water, but it was a pretty day for sightseeing.

I do not know why the ELT did not activate unless I was successful at making a low impact entry to the water. The ELT batteries were checked at the annual inspection, 10 year duracells installed in 2017. ELT functionality was checked at the annual inspection. Could replace the 121.5 mhz system with newer ELT, but again, don't know why this one did not activate.

EVACUATION OF AIRCRAFT

Was an emergency evacuation of the aircraft performed? ☒ Yes ☐ No

Method of Exit – Describe how the occupants exited and how many occupants evacuated each location

I was only person onboard, flying left seat. Just before flare for water landing door unlatched and harness released. Able to push door open against inflow of water and roll to left out of the plane and into the water. Used inflow of water to help close the cabin door behind me.

Annual inspection was completed approximately 8 flight hours before this incident. After the RAM major overhaul engine installation at approximately 326 hours before, 2 ADs could not be confirmed complied with, the hydraulic lifters installed, and the cylinders installed.

Although the installed hydraulic lifters were not listed in the AD, they were found to be pitted after 326 hours in service and were replaced.

The 2nd AD was for the ECI cylinders installed. Although not required to be replaced by time, I decided it was best to replace the ECI cylinders while the engine was opened up for the lifters with my mechanics recommended Superior cylinders, completing a top end overhaul.
