skids, spray gear, and tail section seperated from aircraft uppon impact, rotor blades badly bent, windscreen shattered, instrument cluster broke off, seats collapsed, fuselage destroyed from secondary impact and rollover

**NARRATIVE HISTORY OF FLIGHT** *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

On June 8, at approximately 11:30AM, I departed from the ground with 50 gal of herbicide in my tank and about 10 gal of fuel in the helicopter with the intent to spray a 20 acre pasture about 5 miles east of the load trailer. The temp was 72F giving me a DA of about 6200ft with a NWN wind of about 10-12kts shifting to the North. I departed from a grassy area with a left quartering headwind with no performance issues. Upon reaching the field I conducted an aerial survey from about 100ft AGL to determine the best way to spray the field and if there were any obstacles that I needed to avoid. During the survey, I noticed the aircraft seemed to be lacking performance therefore I made my first pass directly into the wind to get rid of some chemical and determine if I would be able to continue. While pulling out of the field I was not content with how the first pass felt, therefore I dumped about 5-6gal of chemical on target in order to try and increase performance characteristics. I then made one more circle and decided to set an "A/B" line on the south end of the target area running East and West to work the field towards the North in order to have a direct cross wind with each pass. When I completed my circle I was flying South at about 100ft indicating about 50kts with a tailwind, I then made a gradual 90degree right turn in order to start my decent into the field and immediately started loosing rotor RPM. At this point I tried to roll throttle on, but it was already wide open, I lowered collective as much as I could and pointed the nose towards the ground in an effort to gain more forward airspeed and allow the engine to spin the rotors back up, but they continued to decay. With about 50ft left to impact I dumped the remainder of my load hoping it would be enough to keep me in the air, but as I watched chemical pouring out of the tank in the shadow on the ground with no increase in rotor RPM, I knew that ground impact was imminent. At the last second I flared in an attempt to burn off some forward airspeed, but still struck the ground at about 60kts and the helicopter began to come apart from there. Fortunately I managed to walk away with only minor injuries.

**RECOMMENDATION (How could this accident/incident have been prevented?)**

## Operator/Owner Safety Recommendation

Pending the outcome of an Engine inspection, I'd have to say that three factors combined; Density Altitude, Weight, and Wind Speed had a role in the outcome of the situation. Any combination of two of the three factors would have been manageable, but the three combined put the helicopter about at its limit, then by making that right turn to line up for my first pass, there was simply not enough power remaining to compensate for the tilt in the rotor disc. Given the conditions, I should've split that last load into two loads, which would've eliminated one of the three factor (weight) and there wouldn't have been any issues sustaining flight.
