Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Nose of aircraft to rear of front pilot seat: cabin, airframe, instrument panel, tricycle landing gear damage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Departed 113 1930 for local flight and ground reference maneuver practice. Traffic upon departure consisted of 2 each powered parachutes using runway and taxi area 501ft msl to 1000ft msl. The two pilots were not using radios and did not acknowledge my radio communications. Upon departure I flew directly south 3 miles of 113 to practice ground reference maneuvers. I spent approx 30 minutes south of the airport at 1100 ft MSL. I then departed north approximately 12 sm to fly over Coal City, and my farm. I loitered over the area for about 30 minutes and then turned south to return to 113. As I closed with the airfield I remembered the Powered parachutes in and around the airport and tried to get a visual on them. I could not see them at that time. I then decided to fly west of the pattern to see if I could obtain a visual from the west. My altitude was 2000 msl, 1500 agl and was cruising at about 5000 rpms. Almost due west of 113 my engine suddenly lost power to 2500 rpms. I then conducted a function check of my throttle assembly. All was normal with the throttle. In scanning my gages i noticed that my water temp erature was rising fast. I trimmed for best glide and began looking around for a suitable landing space. I could not make it back to the airfield. I saw several corn fields but none were suitable due to obstacles. The obstacles I faced were trees, High tension power lines, low level power lines, Farm dwellings and buildings and small broken fields gravel roads with deep ditches on each side and a hillside I needed to clear. To avoid the obstacles I was channeled between trees and west of the high tension power lines. The engine ceased what seemed like 30 seconds after losing power. I tried to restart the engine and could not get it to turn over. I was now dead stick at 500 ft. I tried to maintain glide speed but could not as the non-spinning propeller was acting like an anchor. I lost all lift just short of the field. I was not able to clear the road and struck the ground on the east side of the road and bounced across the road coming to a stop on the west side of the road (my intended touch down point) upside down with the aircraft resting on its wings.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

If the Powered parachute flyers had radios I could have communicated my intentions to land without worry of a landing interdiction. If i had come straight in to runway 018 I would have had enough altitude to land safely on the airstrip. The powered parachute pilots have been warned in the past. That is why I chose to make a detour until I could positively identify their location.

Had I been flying at 2500 feet I would have been able to conduct an off airport landing with little problem. But being so close to the airport I was trying to stay close to pattern altitude.

All aircraft departing and landing at 113 are required to have suitable radios and maintain radio communication with traffic within that air space.

I reccomend that this be a requirement for all aircraft operating in G and E space.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)

Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Engine failure, lower connecting rod bearing failure at the crank. Needle bearings fragmented and worked their way up into the cylinder where they melted and caused the engine failure.
