Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft struck the power line with the top portion of both rotor blades on roughly the last two feet near the blade tips. The aircraft then fell, impacted the ground at which point the skid type spring and yield gear was removed from the aircraft, and rolled onto its right side. The impact was centered on the lower right nose of the aircraft causing the instrument panel to collapse. The cab of the aircraft was torn under the PIC seat and the seat itself was completely collapsed. The aircraft was rendered completely inoperable.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I had departed out of the local RiceTec facility in an off airport manner and proceeded to my section of rice fields that I would be working that day. Upon arrival I made a mental note of the large power lines that separated my two fields which would be no factor in my low level operations, only when traversing from one field to another. After I had finished my fields for the day I hopped over to a coworkers field who was directly abeam me on the other side of the power lines. I traversed the power lines here for the third time that day with no incident and plenty of altitude. Upon finishing the one field that my coworker was working on we moved to his last section which was on the same side of the power lines but planted at a roughly 45 degree angle into the lines themselves. At this point I landed to refuel the aircraft to ensure I would meet fuel requirements on the return flight from the fields to the base of operations. Upon picking up again and assessing the rice field as well as what rows my coworker had already completed I moved in a direct path towards the power lines perpendicular to the direction in which they were running. Unfortunately with the way in which the rows were planted I would have to be operating in close proximity to the lines themselves however, the lowest line was what looked to be about 40-50 feet above ground level. With this in mind as I approached the power lines I was no more than 3 feet off the top of the rice, ensuring as much vertical clearance as possible. I had kicked the helicopter out of trim with a right pedal input to slow the aircraft down with out pulling aft on the cyclic which could have resulted in a tail rotor strike with the rice field itself. I further slowed the aircraft with a slight right cyclic input once the helicopter was facing parallel the wires. As I leveled from this flare to push into my rice row I felt a jolt which I can only describe as hitting a pothole on a highway doing 65mph. This bounce pushed my vertically towards the power lines and I tried to correct by lowering the collective as soon as I had felt the impact of what I assume to be a gust of air or thermal from the differing vegetation. Unfortunately this was not enough and I continued upwards until contacting the lowest power line with the outer few feet of either rotor blade. The impact of the blades caused the helicopter to violently yaw to the right and pitched the helicopter in an extreme nose down position. At this point with the collective still being lowered from the gust/thermal I pulled full aft cyclic to raise the nose as much as possible and prior to contact with the ground I fully raised the collective in an attempt to lessen the blow on impact. I closed my eyes just prior to contact with the ground and opened them after the helicopter had come to a rest. In this span of time I never lost consciousness and proceeded to shut off the master and alternator switches before crawling from the aircraft to the position I was in when found by paramedics.
