NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

It was a normal and stabilized approach. I had crossed mid-field and entered a left downdraft for runway 30. Turn to base was normal as was turn to final. Based on the wind information from the automated system I decided on a three point landing. At about 1 foot off the pavement I encountered an unexpected wind gust from the left, yet I was already at stall speed and the plane was pushed left resulting in the left gear touching the runway first with a drift to the right. The shock on the left side broke and the plane swerved to the right. At this time the tailwheel unlocked and the plane continued in a ground loop. The left wing touched the ground and was bent outside the struts. No damage was incurred to the prop due to the safety cables I had previously had installed. The accident was immediately reported on the CTAF and airport personnel assisted in moving the plane to a hanger within 30 minutes of the incident. Neither I nor my daughter were injured.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Kerrville has a reputation for gusty wind conditions and while I believed at the time I had planned the landing so that it would be successful, the gust caught me in a landing configuration where I was unable to maintain directional control at touchdown. Landing on asphalt in a Cub is tricky to begin with and wheel landings seem to provide for better control-ability. I would recommend executing wheel landings in a Cub on asphalt as all times. That is expect the wind to shift or gust even if noe was detected on final approach.
