Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Substantial damage to propellor, left and right wing, fuselage and vertical stabilizer.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The accident occurred during roll-out after the airplane returned from a 2hr sightseeing flight in the Colorado mountains. Clear skies and barely any wind.

* The airplane took off at KBDU, runway 08 at 8:45 local time. At that time the runway was covered with ~1in of hard/dry snow.

* At 11:00 local time the airplane entered a left-hand downwind pattern for a full-stop landing on runway 08 at KBDU.

* The airplane was number 3 in the pattern with number 1 and 2 in sight (both announced a touch-and-go). To ensure adequate spacing, the airplane extended its downwind by ~0.5NM before turning base.

* The runway appeared to the pilot as a snowy runway similar to the conditions on take-off, with only few tracks from previous aircraft that had landed/departed. In reality the runway was a combination of slushy and wet snow with patches of ice as the sun had started to melt the morning hard snow (one could barely walk without slipping).

* The airplane landed using 20degrees of flaps using a soft-field landing procedure with a approach to landing speed of 65kts IAS. The airplane touched down softly in the first 500ft of the runway on the center line and continued rolling down the runway on its 2 main tires. The pilot did not use the wheel brakes and kept the nose wheel off the runway as long as possible.

* Initially, the pilot had directional control over the airplane with all three wheel on the runway.

* After the nose wheel touched the runway, however, the airplane skidded to the left. At this point the speed had decreased too much for a safe go-around and the airplane would risk hitting the snow bank immediately adjacent to the runway accelerating and at full power (rather than with its engine at idle power and decelerating).

* The pilot managed to keep the airplane on the runway for another ~1500ft before the left main tire caught the snow bank on the side of the runway.

* The airplane tipped on its nose. For a moment it felt as if the airplane would drop back on its main tires, but eventually rolled on its back.

* The pilot switched off the avionics, magnetos and main switch, and exited the plane to subsequently help his passenger to exit the plane safely.
