N5179D, a Cessna 182 taildragger, had completed a major overhaul and upgrade. The Annual Inspection was signed off on 04/27/2020. Beginning on 04/27/2020, maintenance flight testing was being conducted to break-in the engine and make final adjustments to the aircraft and newly installed equipment. These flights totaled 22.4 flight hours and 17 landings. There had been no significant issues or problems on any of the test flights prior to the occurrence on 05/22/2020. The same pilot flew test flights #2-11, which totaled 20.9 flight hours and 16 landings.

The 11th test flight was scheduled for the evening of 5/22/2020, with a forecast of clearer skies and calmer winds. The pilot flying checked the weather, calculated the weight & balance, and submitted a company VFR flight plan. The pilot and another pilot, who was gathering and recording test data, departed the Ionia County Airport (Y70) at 6:12 pm EDT. They activated their company flight plan and contacted Great Lakes Approach for flight following. They flew to Lansing (KLAN) and performed the ILS 10 R approach. After the missed approach they proceeded to the practice area to continue the testing. Returning to Ionia (Y70), the AWOS reported winds calm, but some smoke indicated it was very light from the north. The pilot chose to fly the RNAV approach in visual conditions and land on runway 27 with a light right crosswind. They flew a stable approach of 70 mph with full flaps, planning on a 3-point landing.

The pilot approached over the centerline, reduced the power to idle, and began the flare. The attitude was not quite to 3-point and the plane momentarily leveled off in ground effect. As the aircraft settled, the pilot pitched to what he thought was the 3-point attitude. The stall horn sounded just as the airplane touched down around the second runway stripe. As soon as the plane was on the ground, the tailwheel began to shimmy violently. Both pilots observed the airplane touch down in a 3-point attitude, and they don't think the pilot had over-flared, which would have caused the tailwheel to touch first. Throughout the roll-out the pilot held the control yoke back to keep the tailwheel firmly on the runway.

After touchdown the airplane began to drift to the left. The pilot, flying from the right seat, does not know if, subconsciously, he was slightly yawed to the left in an effort to increase his visibility over the nose. At the furthest point the tail wheel was 16.5 feet left of centerline at a point 22' from the east end of the fourth runway stripe. The tailwheel continued to shimmy throughout the landing roll. The pilot was on the rudders, providing whatever directional control he could muster from the rudder even though the shimmying tailwheel was providing almost no steering. The pilot was able to track a fairly straight path for the next 260'. The pilot began to turn to the right to correct back to centerline. To recorrect to parallel the centerline, full left rudder was applied. At that point, either his left shoe caught on something and jammed the pedal, or the left rudder pedal stuck in the full left rudder position. He couldn't move the pedal to provide any directional control. The airplane then began to ground loop to the left about the end of the fifth centerline stripe. The rudder pedals responded normally after the aircraft came to a stop.

During the ground loop, the right tire side loaded enough for the rim of the wheel to make contact with the ground. As the tail of the aircraft came around the right wing tip and aileron made contact with the grass just off the edge of the runway, and the right elevator made contact with the runway surface. The right wheel came to rest about two feet off the edge of the runway. The tailwheel stopped about one foot off the runway. The aircraft stopped after turning approximately 180°. This occurred at 7:18 pm EDT. No one was injured. The engine was still idling and running normally when the airplane came to a stop.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

1. In a conventional gear aircraft, always be ready for problems that may occur when landing, such as a shimmying tailwheel, a flat tire, a crosswind, or the loss of braking capabilities on one wheel.
2. When experiencing a tailwheel shimmy, add power and apply forward pressure to lighten the load on the tailwheel and to provide additional direction control with the increased airflow over the rudder. Brake firmly while maintaining directional control with the rudder. Then reduce power, lower the tail, and quickly brake to a stop.
3. Possibly conduct a go-around and consider other options, such as landing on a grass runway.
4. Schedule regular training with an instructor to practice bounce recovery and swerve recovery procedures.
