Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Cirrus Airframe Parachute System (CAPS) deployment; aircraft tail disconnected from fuselage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On January 27, 2020, an instrument flight rules (IFR) flight plan was filed from Aspen-Pitkin County Airport (KASE) located in Aspen, CO to Eagle County Regional Airport (KEGE) located in Eagle, CO, in a Cirrus SR22T model aircraft, registration number N288WT. The flight was operated pursuant to 14 C.F.R. Part 91 with one pilot and one pilot/passenger on board.

The pilot and passenger arrived at KASE at approximately 1:00p.m. MST. Before departing, the pilot waited until approximately 3:00pm MST while the weather improved at the destination airport. The pilot checked weather information from Foreflight and Skew-T (i.e., NOAA Storm Prediction Center). Weather at the time of departure was reported to be instrument meteorological conditions (IMC).

Prior to starting the aircraft, the pilot cleaned melting snow off the airframe and plugged in the preheat system to warm up the engine. During the preflight, the pilot visually inspected the entire airframe and flight control surfaces for snow and ice contamination. He also physically inspected the pitot tube to ensure that it was unobstructed and properly heated.

After completing the initial preflight inspection, the pilot returned to the fixed base operation (FBO) building to check the updated weather and retrieve the luggage to load the plane. After loading the plane, the pilot conducted another preflight inspection to confirm no presence of airframe snow or ice. He inspected the fuel, and confirmed proper operation of the aircraft lights and pitot heat.

After entering the aircraft, the pilot performed an extensive preflight check of the aircraft systems. The engine was started and he immediately turned on the pitot heat. The pilot did a longer than usual engine run-up/checklist. Before takeoff, he ensured that the entire airframe was covered with TKS deicing fluid.

The IFR flight plan was loaded into the Garmin G1000 flight management system (FMS), including the LINDZ Nine standard instrument departure (SID). The pilot activated the flight director and began the takeoff roll on runway 33. When the pilot confirmed that the airspeed reached 78 knots indicated airspeed (KIAS) on the primary flight display (PFD), he rotated and departed the runway surface.

Shortly after liftoff, the indicated airspeed decreased dramatically from normal climb speed to less than 20 KIAS. Immediately thereafter, the PFD completely stopped indicating any airspeed, which resulted in red X's being displayed. At the same time, the backup airspeed indicator became unreliable and was rendered useless.

At that point, the pilot made a command decision not to immediately return back to the airport as a result of the surrounding rising mountainous terrain. Since he needed to ensure adequate terrain clearance before turning back to the airport, the pilot turned to a northeast heading. During a climbing turn to the northeast, the airspeed indicator became "alive" again. Once airspeed was confirmed, the pilot began to retract the flaps.

The pilot activated the flight plan in the Garmin G1000 FMS and engaged the autopilot, at which time the aircraft encountered IMC. Moments later, the airspeed indicator once again failed and displayed red X's on the PFD, resulting in a failure of the autopilot to remain engaged. Since the aircraft was on a northeast heading, the pilot realized that he was quickly approaching the surrounding rising terrain without visual reference to the ground. He decided that it would not be safe to turn back toward the departure airport in mountainous terrain without any airspeed indication while flying in IMC, so he decided to climb and avoid the terrain directly ahead of his course. Without indicated airspeed or a functioning autopilot, it did not appear safe to return to KASE while operating in IMC, especially in light of the low ceiling.

Considering the above, the pilot decided to activate the Cirrus Airframe Parachute System (CAPS). Prior to activation, he aggressively climbed the aircraft to get high enough for a safe CAPS deployment. During the climb, the pilot monitored the terrain on the PFD Synthetic Vision Technology (SVT) to ensure that it changed from red to green (i.e., safe terrain clearance) before activating the CAPS. (Cont. P.11)

(Narrative Cont.)

After activating the CAPS, the aircraft first pitched nose down and then leveled out while the parachute filled. At approximately 200-300 feet above ground level (AGL), the aircraft slowed dramatically. The aircraft landed in the only visible clearing at an approximate 35-degree pitch on the mountain. The aircraft touched down in at least six feet of powdered snow, which softened the landing. The aircraft tail disconnected from the fuselage.

Upon activation of the CAPS, the passenger immediately notified air traffic control (ATC) via the aircraft radio and requested assistance. While on the ground, the pilot continued to communicate with ATC via aircraft radio. He also had full use of his cell phone inside the aircraft. The pilot and passenger remained inside the aircraft with the doors closed in order to shelter themselves from the outside elements and cold temperature. After more than five hours, a rescue crew arrived by foot.

The pilot and passenger safely exited the aircraft through their respective cabin doors without incident or injuries.
