Narrative History

This is a narrative history of an accident involving N1011M, occurring on February 9, 2020. The airplane was purchased in November of 2019 and underwent extensive inspection, as it had not been flown or undergone an annual inspection for two years. All hoses and lines were removed and replaced, as well as repair of flap torque tube and bushings. Many other areas were inspected as outlined in the annual inspection reports that were signed off on 2/8/2020. The plane had been transported on a ferry permit prior to that and had accumulated about five hours of flight after the plane was reassembled. Once the annual had been fully signed off in its entirety on 2/8/2020, initial training was commenced in the plane, consisting of 2-hours of ground school and 8.5 hours of dual training for initial. The check pilot who provided the instruction was transported back from Wahpeton, North Dakota to Bottineau, North Dakota, which was approximately a 2-hour flight. The flight back to Wahpeton was 2.0 hours and an additional 5.25 from Wahpeton, North Dakota to Fort Smith, Arkansas (non-stop) on the evening of 2/8/2020. Around 12:00 pm Sunday, 2/9/2020 instruction was provided by me to my wife, consisting of a walk-around inspection of the plane with extensive pre-flight briefing instruction to include inspection points, as well as the gasolator sumps and wing-tip sumps were located and how to sump these. All areas of inspections were normal. No leaks were noted. Oil levels were found to be within normal range. At this point I, as P.I.C. sat left front seat, my wife sat right front seat, and our two friends sat in the back seats, proceeded to take the plane out to do touch and goes in the pattern. The winds were light, prevailing out of the south, with ceilings overcast at approximately 3,500 ft. The plane started without incident. Normal run-up was carried out with normal indications on all instrumentation. After run-up was completed, the airplane was back taxied on runway 7 at KFSM to taxi way delta. The plane was then brought up to normal RPM's with normal take-off being noted.

The plane departed to the east, veering towards the northeast practice area for about 3-4 miles to conduct some docile turns, in an effort to get my wife accustomed to the characteristics of the plane. We were then cleared for the option to land on runway 19. Normal landing with touch and go was noted. The plane on roll out generated full power with a left ascending turn. The plane then entered left downwind at pattern altitude of 1500 feet. I instructed my wife on how to switch tanks to the wing tanks during level flight. This was done without incident. At that point the tanks were then switched back to the mains, prior to entering left base, again with the engine never faltering. Left base was then entered onto runway 19 with option. The turn to final was without incident. A second touch and go was carried out with normal climb out, generating normal power. At that point, we again entered into left downwind pattern for what was to be a third and final planned touch and go. The plane touched down without incident. Full power was applied with normal performance. Again, a left turn entered, to enter the downwind when at approximately 300 feet the plane's engine faltered. The nose was pushed over to level flight. The engine continued at that point. We then continued in our climb with a left turn, at which point we had a complete loss of engine power.

The boost pump was turned on, at which point the engine re-fired, notification was given to the tower of engine out and the need to immediately head back to the ground. The tower acknowledged, at which point seeing that we were past runway 7 in a left turn, it was impossible to put the plane down on runway 7. Option at this point was to continue in a gliding pattern at approximately 80 knots in a slow left hand turn in order to clear a Delta passenger plane on taxiway alpha, which I had to over fly. I swung wide of the Delta plane and maneuvered in between the Fort Smith fire house and terminal building, avoiding both structures so no contact would be made. With my knowledge of the field, as it is my home base, I knew there was a flat area of grass that sat on the northeast side of runway 1, making this a reasonable option to land on, due to it being impossible to get to runway 19 and unfortunately taxi way alpha, as it was tied up with the Delta plane. We were on a glide path within a stable configuration. Knowing there was a large drainage ditch we would likely impact the far bank, based on current glide slope and altitude decay. I maintained the same glide until just before the ditch, at which point the elevator was pulled back, allowing ballooning of the nose to prevent impacting the ditch. The plane then put down in the grass, skidding approximately 160 feet. There was no smell of gasoline or fire. All electrical systems were turned off prior to hitting the ground. After the plane came to a full stop, assessment inside the plane revealed my wife in the front co-pilot seat to be relatively uninjured, only some bruising to the right knee, elbow and ribs. The person in the right rear seat (Charles Stanick) suffered from contusions of his leg from impacting the right front seat. Julie Stanick, who was sitting in the left rear seat, suffered from immediate back pain. This seat had broken from the rails. I received lacerations to the brow and contusions to the forehead. There was no loss of consciousness by myself or anyone else in the plane. Two passengers (my wife and Charles Stanick) were able to exit the plane immediately. I remained in the front seat, staying with Julie Stanick. Julie's injury turned out to be a compression fracture of L1. I remained in the plane until EMS presented, at which point she stood and evacuated herself out of the plane, being placed on a back board and transported to the hospital. Ms. Stanick was kept in the hospital overnight for observation and discharged home the next day. Julie is currently in a back brace, pending the decision as to whether she will require a Kyphoplasty, due to the 30% compression of L1 vertebrae. My lacerations required simple suturing with no other treatment required.

It should be noted the plane is a total loss, as it had damage to the fire wall where the engine mount had pulled from the wall, prop strike, as well as damage to the wing spars. The NTSB and FAA were notified of the incident, as well as our insurance agency, who notified our insurer U.S. Specialty insurance.
