Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left wingtip struck object, leading edge wingtip damage. Landed gear up in grass, windmilling propeller made contact with ground. Skin crumpling along fuselage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

At the start of the flying day at KBJC I determined that 37 usable gallons of fuel were on board based on visual inspection, fuel gauges, and flight time previously performed, sufficient for more than three hours of engine operation while total flight time was expected to be less than two hours. This was updated to 25 gallons by the same methodology at KFMM. Fuel gauges and flight time placed the aircraft at 15 usable gallons on return to KBJC just before 21:00 local, with five usable gallons indicated on the left and ten usable on the right corresponding to more than an hour of engine operation.

During boarding for both the outbound and return legs of the flight there was some trouble getting the shoulder harness of the seatbelt to initially extend. In both cases specific attention was required to allow the ratchet to release so the shoulder harness could be worn. We requested a touch-and-go followed by a full stop at KBJC, which was cleared as a touch-and-go. This would be expected to extend flight time by approximately 3 minutes, leaving plenty of reserve.

Shortly before the base-final turn the pilot station shoulder harness locked up without any apparent jarring or precipitating event. It did not release through two cycles of being given slack. Instead it took the slack and remained locked, uncomfortably pinning the pilot to the seatback. Due to the immediate proximity of this event to touchdown the touch-and-go was performed as cleared at approximately 21:00 local.

Before sufficient altitude was attained to safely remove and address the shoulder harness, but after being out of usable runway and gear retraction, the engine suddenly stopped producing thrust as felt via the seat as well as audible changes. Believing that the most likely fixable issue would be related to fuel flow and knowing that the mixture and auxiliary pump switch were set and unchanged from a pre-landing checklist I attempted to switch tanks to recover power while flying to maintain airspeed and control as well as best positioning for a forced landing in case power could not be recovered.

I was unable to manipulate the fuel selector on multiple attempts due to the shoulder harness. I was unable to release the shoulder harness on multiple attempts due to the tension maintained by the ratchet. Only the left pilot station can reach the fuel selector, so no other person could perform the change. I rejected releasing the lap belt as extremely dangerous because any attempt to re-latch the belt would have taken both of my hands and most likely my eyes off of flying while compromising safety of myself and passengers in multiple additional ways. Unable to recover power in the 15 or so seconds available, the forced landing was performed on grass and terrain beyond and to the left of 30R.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Pilots Handbook of Aeronautical Knowledge Chapter 7

(https://www.faa.gov/regulations_policies/handbooks_manuals/aviation/phak/media/09_phak_ch7.pdf) discussion of fuel gauges states "Aircraft certification rules require accuracy in fuel gauges only when they read "empty." This item appears to differ significantly from previous and current regulations, and the discussion around it appears to poorly represent best practice.

It was not clear or obvious that the malfunction of a single seatbelt could or would prevent anyone on board from manipulating the fuel selector and would therefore take a substantial amount of the pilots time and attention responding to a loss of thrust in a critical phase of flight whether or not that manipulation could have made a difference in the outcome of the situation.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Shoulder seat belt: See narrative. difficulty in operation or ratchet. Seized in smooth flight, pinned pilot to seat and could not be released, interfered with reaching and manipulating the (pilot-only) fuel selector.

Possible calibration or operation issue with right fuel gauge - read 10 gallons (usable) in check minutes prior to the end of flight. (Total indicated fuel appeared to be in line with the expected fuel level based on pre-flight determination combined with expected fuel consumption).
