Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Nose gear bent when aircraft flipped upside down in soy bean field. Damage to prop, spinner, oil pan, air intake, wings and cabin compartment. Tail and aft control surface damaged. Unsure of any aft fuselage damage. Only property damage is loss of some soy bean plants in path of landing.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Performed preflight and filled tanks to approximately 23 gallons of fuel when taking into consideration the small header tank (apprx. 1 gallon) we installed on the right tank. Dipped the tanks with calibrated dip stick marked off in gallons with just slightly more than eleven gallons in each tank plus the header tank of approximately 1 gallon. Had unreliable on board fuel indications when trying to calibrate them on the Dynon system on initial calibration attempt after installation. We did not trust or monitor the Dynon system for fuel indication in flight. Departed KMMI (home airport) at 07:41 EDT per FlightAware enroute to KCEY (Kyle-Oakley) near Murray, KY for fuel stop. Arrived KCEY at 09:09 CDT per FlightAware and took on 15 gallons of fuel that filled the left tank and in my visual estimation came within 1 to 1.5 gallons of filling the right tank (close to full). I estimated 6 gallons per hour fuel burn rate and it took right at 2 1/2 hrs to arrive KCEY and estimated KCEY to be close to the midway point of travel. I did not dip the tank to accurately measure the exact number of gallons in the right tank but felt confident that fuel would not be an issue. Departed KCEY at 09:58 CDT per FlightAware enroute to KMYJ, Mexico, MO using Washington County (8WC) as a way point to avoid St. Louis Class B airspace. According to FlightAware I was indicated down short of Mexico, MO at 12:58 CDT. I slightly pulled throttle back at an altitude of ~3000 feet to start slow altitude loss for TPA entry about 10-15 miles from airport when the engine came to less than idle rpm, then immediately came back to some medium rpm for approximately 2 seconds, then stopped completely. Prop started windmilling so I slightly raised the nose which stopped the windmilling and immediately turned Eastward which would bring me to a heading of the field I selected for landing. Final touchdown was harder than normal but not damaging until the nose wheel struck the ground and caused the plane to flip over upside down. Soy beans where on the average about 3 feet high. While hanging upside down in the seat belt, I switched off some of the electronics and went to the off position with the fuel selector valve. Should have turned off master switch but don't remember if I did. After exiting the plane I called 911 while walking out of the bean field to the only house I could see. House belonged to a Mr. Sommers at 62 Sailor Rd., Montgomery City, MO. No one was home but state and county officers showed up at the house after I gave them the address from a UPS package left on the front porch. After a couple of hours they located the plane which could not be seen from the house and allowed me to place my personal belongings in their vehicle after I cleared the removal with the FAA. I was taken to the Montgomery City Sheriff's office to wait on my personal items to be delivered. After receiving my personal items, I was taken to my reserved motel in Mexico by a Montgomery sheriff's deputy.

Weather and visibility were not an issue for the entire flight. Although I said wind was from the E-NE, Ground speed was within 1 to 2 mph of airspeed from CEY to engine stopping an average of 83-85 mph.

Pilot Operating Handbook was left in the plane.

Registration and Airworthiness Certificate was on back wall of baggage compartment.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

This was first long cross country flight .

My partner and I replaced the Marvel Shebler Carburetor on the plane in May due to a leaking seal with a newly overhauled Marvel Schebler Carb of same model and design. We verified a 6 gallon or less fuel burn rate per hour on the old carburetor several times but did not verify this burn rate on the newly overhauled carb before this flight. This could be of concern for this flight.

I, per the operating handbook, assumed a 1 gallon unusable fuel quantity per wing, but did not verify this during the building process. We added a small header tank of approximately 1 gallon on the right wing tank to ensure fuel to engine while maneuvering in the pattern for landing due to the fuel takeoff line position at the center rear position of the tank. An after-off-field-landing thought makes me wonder what the true amount of unusable fuel is really is.

I don't know if carb ice was involved. I did not pull carb heat after engine stopped. Was not even a thought with low altitude I had to work with.

I also don't know if carburetor flow rate was functioning as expected. Engine was running good. Looking back, I should have known.

I don't know if fuel was interrupted to the engine from some other source.

Looking back, two fuel stops may have been warranted.
