Lesson: Landings and Pattern work

KAPA-KCFO-KAPA

Good lesson/discussion regarding landings focusing on stabilized approach (config, airspeed, glidepath, centerline) and GA if not stabilized at 300'. Keeping the nose pointed at the numbers and flying into the flare has been an issue so this lesson was to work on that aspect and getting into ground effect, leveling off and waiting for airspeed to bleed off and touching down at stall speed. Student performed three progressively better full stop taxi back landings at KCFO. No help from instructor on final landing at KCFO.

Returning to KAPA ATIS information Victor 220@10-15 assigned left base rwy17L.

Cleared to land RWY17L from a left base. On base full flaps speed was ~90. Turned final and maintained speed 80-85. Stabilized approach was established at 500' (configured, on speed, alignment, descent rate). Maybe 200-300' speed moved towards 90 and notice power at 31%, slightly above GS. Student recognized issue and reduced power and leveled off momentarily, speed came back to 85. Plane started to weathervane so student added left rudder and right aileron (crosswind correction). Wings started to 'rock' left to right, Instructor said "be prepared for GA". Speed check over the threshold was good (80ish). Student leveled off early over the numbers ~50' and airplane ballooned. Student added small power to correct the balloon, but did not level nose, plane started drifting left of centerline, then gust of wind raised right wing. Instructor called GA, student's response was delayed in my opinion, so I called "I have the controls", added full power (student's hand remained on throttle) and right rudder. Student 'froze' on the yoke (did not let go). Airplane continued left as instructor tried to overcome student's left turn input and a/c left turning tendency. As plane continued left I looked left and noticed student's hand still holding yoke tightly and deflected left and was pulling back. Instructor was unable to overpower yoke inputs. The plane continued left with left wing low, upon seeing the grassy area between rwy and taxiway and contacting ground Instructor said "oh shit". Plane slid laterally across taxiway before coming to rest in between taxiway and apron. I asked the student if he was alright, performed shutdown flow, unbuckled and exited the a/c. No ELT activation. Additionally, neither instructor nor student remembers going against the seatbelts.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Increase practice of positive exchange of flight controls. Increase number of go-around practice events. At first indication of non-stabilized approach, execute go-around.

IA established a Safety Committee and is looking at instructor minimums for hiring. We are also started six month recurrent checks with all instructor pilots. We will continue to hold monthly instructor pilot meetings and include safety topics in the discussion. Additionally, the Safety Program Manual and Emergency Plan have been updated.
