Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Collapsed nose gear and left main. Prop strike. Significant damage / distortion to both wings. Damage on left side of rear stabilator. Possible bent fuselage at firewall, with visible wrinkling of exterior surface.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I departed KFNT in clear conditions at ~8:25AM on 5/29/21 with 45 gallons fuel on board, (13 in left tip, 13 in left main, 6 in right main, 13 in right tip) with the fuel selector on left main tank. The intention was for a flight duration of ~1 hour, with some practice maneuvers to the northwest of Flint, followed by a return to KFNT for a series of touch and go's and a final full stop landing. Just prior to departure, I set a timer mounted on the yoke to 30 minutes as a reminder to switch fuel tanks. After departing KFNT, I proceeded to the practice area about 15 miles northwest of KFNT for maneuvers. After about 20-25 minutes, I concluded my maneuvers and began my return to KFNT with intentions to perform several touch and go's. I requested to Great Lakes Approach to alternate between runways 9 and 36, and was given clearance for a straight in approach to runway 9. When on ~3 mile final to runway 9, the timer expired to remind me to switch tanks. I noted that the timer had expired, but elected to switch tanks later, while not on final approach. Unfortunately, I did not remember to switch tanks after this point and the fuel selector remained on the left main tank for the duration of the flight. I had completed touch and go's on runway 9, followed by 36, then 9, and the final touch and go on 36. On initial climb out from runway 36, I began a left turn about 0.5 miles north of the field to enter left downwind for runway 9. It was at this point the engine began to sputter and lose power. I lowered the nose of the airplane to avoid a stall and continued the left turn to a heading of ~170 degrees to return to the airfield. With the engine still sputtering and losing altitude, I declared an emergency with Flint Tower and that I was returning to the airport for an attempted landing. After a few moments, the tower cleared me to land on runway 9, but in my judgement I did not have enough altitude to glide for a landing on runway 9, and I responded that I was "going for the taxiway." (parallel taxiway C) I continued on my heading of approximately 170 with intention of making a left turn to 090 to land on taxiway C. As I approached taxiway C less than 100 feet above the ground, I made my turn but slightly overshot the taxiway. As I attempted to steer the plane back over the taxiway, I held too much back pressure on the yoke in an attempt to remain airborne until over the taxiway. The airplane subsequently stalled from approximately 15 feet above the ground. The airplane struck the ground on the edge of the taxiway, striking one taxiway edge light, skidding from right to left along taxiway C and coming to rest just outside the airport entrance markings on the taxiway leading to the AvFlight ramp, never having left the pavement. It was only after coming to rest on the ground that I had realized my error in not switching fuel tanks as the likely cause of the loss of engine power in flight.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The accident could have been avoided by:

1. Filling tanks with additional fuel prior to departure.
2. Switching to another fuel tank immediately when my timer expired.
3. Remembering to switch to another fuel tank at a later time as intended, since I had decided not to while on final approach.
4. Realizing my fuel management error while still in flight, once the engine began to sputter from lack of fuel.
5. Making a decision to land straight ahead while on the 170 heading.
6. Better stick and rudder performance, to avoid the final mistake of holding too much back pressure resulting in a stall.
